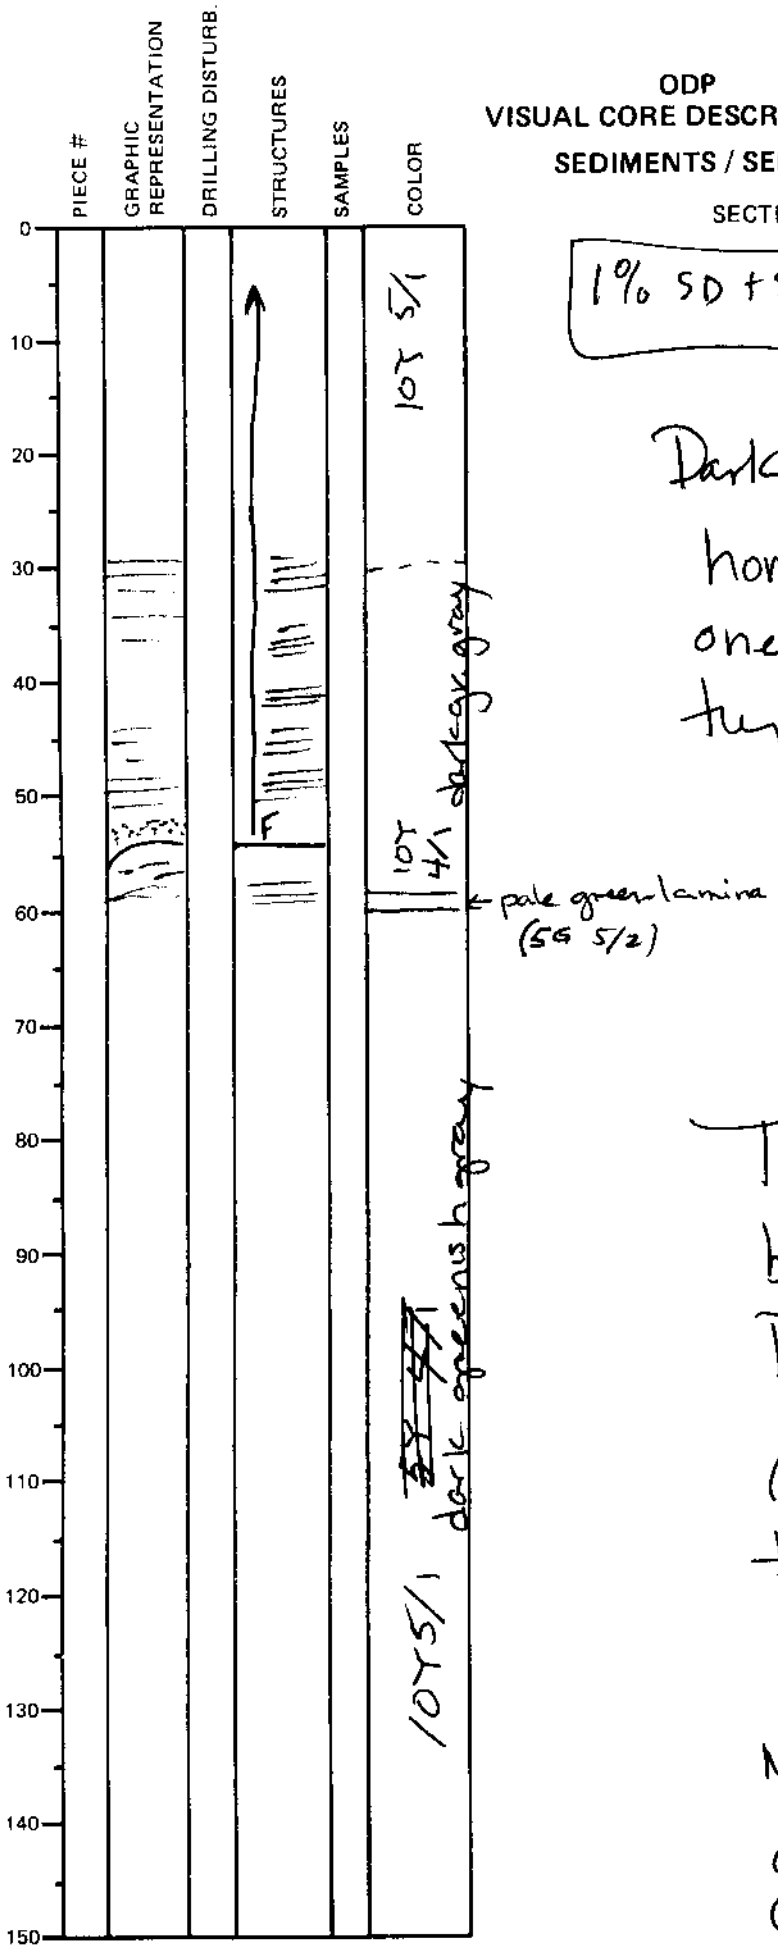
SECTION DESCRIPTION

1% SD + SLT



Dark greenish gray (10Y 5/1) homogeneous CLAY with one v. FINE SAND to SILT turbidite (54–30cm).

The turbidite is underlain by an interval with a pale green (5G 5/2) lamination and a thin (3cm) mottled (pale green + dark greenish gray) CLAY. Smear slide examination of the green material in other cores suggests that the green color is from glauconite (or chlorite?)
