

Initial Reports: Volume 112: Chapter 8: Plate I. SeaMARC II side-scanning mosaic of the Peru continental margin with a transparent overlay of the bathymetry derived from SeaMARC II phase data. This mosaic covers approximately 10,000 km² and was completed in four days.

Note: These plates were published originally in the *Initial Reports* portion of Vol. 112 in 1988. Unfortunately that printing did not do justice to the clarity of the original SeaMARC imagery. Hence, the plates are being reprinted in the *Scientific Results* portion of Vol. 112.
