Prepared by the
OCEAN DRILLING PROGRAM
TEXAS A&M UNIVERSITY

Diana Kennett, Amanda Masterson, Norman J. Stewart
Volume Editors

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Department of Energy, Mines and Resources (Canada)

Deutsche Forschungsgemeinschaft (Federal Republic of Germany)

Institut Français de Recherche pour l'Exploitation de la Mer (France)

National Science Foundation (United States)

Natural Environment Research Council (United Kingdom)

University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

It is recommended that reference to the whole or to part of this volume be made in one of the following forms, as appropriate:

Barker, P. F., Kennett, J. P., et al., 1990. *Proc. ODP, Sci. Results*, 113: College Station, TX (Ocean Drilling Program).

Hamilton, N., 1990. Mesozoic magnetostratigraphy of Maud Rise, Antarctica. *In* Barker, P. F., Kennett, J. P., et al., *Proc. ODP, Sci. Results*, 113: College Station, TX (Ocean Drilling Program), 255–260.

Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is the correct one.

The mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 123 (*Initial Reports*): May 1990
Volumes 124/124E (*Initial Reports*): May 1990
Volume 125 (*Initial Reports*): June 1990
Volume 107 (*Scientific Results*): February 1990
Volume 110 (*Scientific Results*): May 1990
Volume 112 (*Scientific Results*): May 1990

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Library of Congress 87-642-462

Foreword

By the National Science Foundation

The scientists of the Ocean Drilling Program (ODP) have embarked on what could prove to be one of the most important earth science initiatives of the decade—an initiative rivaling in scope and impact the exploration of the frontiers of outer space. The program explores our planet's last frontier—the Earth's structure and history as it is revealed beneath the oceans. The scope of the program's scientific goals excites the imagination, challenges the intellect, and enhances the spirit of cooperation among peoples in countries around the world.

Between 1872 and 1876, HMS *Challenger* undertook the world's first major oceanographic expedition. That expedition greatly expanded man's knowledge of the world's oceans and revolutionized our ideas about planet Earth. From 1968 to 1983, another ship named *Challenger* logged more than 375,000 miles on 96 voyages across every ocean for the Deep Sea Drilling Project (DSDP), operated by Scripps Institution of Oceanography. Among the project's many remarkable discoveries were the confirmation of seafloor spreading and the establishment of the relative youth of the seafloor, thus verifying the dynamic and changing nature of the Earth's crust.

Today, the Ocean Drilling Program, which began in 1983, brings new resources to bear on scientific ocean drilling. A new drillship is in operation—the *JOIDES Resolution*—one of the world's most modern and best equipped drillships with enhanced capability for drilling and coring in polar areas and rough weather, expanded laboratory space, facilities for more scientists, and a major drill-hole logging program. The name of the ship was derived from the international scientific partnership that directs the program—the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES)—and from the flagship of Captain Cook's second voyage to the Pacific Ocean in the late 18th century. Texas A&M University is responsible for science operations in the program, and Lamont-Doherty Geological Observatory is responsible for the logging program.

The Ocean Drilling Program truly has international participation. In 1975, the International Phase of Ocean Drilling began with member nations—the U.S.A., U.S.S.R., the Federal Republic of Germany, Japan, the United Kingdom, and France—all providing funds and scientific guidance for the project. Today, ODP partners include the U.S.A., the Canada/Australia Consortium for the Ocean Drilling Program, France, the Federal Republic of Germany, Japan, the United Kingdom, and the European Science Foundation, which represents Sweden, Finland, Norway, Iceland, Denmark, Belgium, the Netherlands,

Spain, Switzerland, Italy, Greece, and Turkey. The National Science Foundation, with funds contributed by the United States and international partners, supports the scientific operations and planning for the ODP through a contract with Joint Oceanographic Institutions, Inc. (JOI).

The information gained by the program leads to a better understanding of the Earth and its dynamic processes. Drilled sediment cores and logs reveal clues to past climatic history and tie into parallel studies of paleoclimates from glacial ice cores drilled on the continents. Understanding these sediment cores will enable scientists to complete the map of major geologically active regions of the Earth, and to identify processes that lead to dynamic change such as earthquakes, volcanic eruptions, and mountain and continental growth. We are far from being able to predict such changes accurately now; but with the new tools and understanding, the accuracy of such predictions can be improved. This better understanding of the Earth's system(s) will allow us to identify regions of potential mineral and energy resource development, an issue of worldwide human interest. The Ocean Drilling Program is not in itself aimed at finding resources, but the knowledge of the Earth's processes that is gained through such a basic research program will inevitably provide pieces of information required for such resource discovery and exploitation.

The program is fully under way in its aim to further the understanding of the Earth's dynamic systems. People of our planet will benefit directly and indirectly from this research in both their daily living and work activities. This multinational endeavor will perhaps foster other cooperative efforts in science or among societies. The Ocean Drilling Program has distinguished ancestors in the original *Resolution* and *Challenger* expeditions and the Deep Sea Drilling Project. The National Science Foundation is proud to be playing a leading role in this program, and we are looking forward to significant and innovative science for many years to come.

Erich Bloch
Director
National Science Foundation

Washington, D.C.

Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents results from the Ocean Drilling Program (ODP), where scientists use a specially equipped ocean drilling ship to sample and measure the properties of the submerged part of the Earth's crust. These data are then synthesized with other information to yield new insights into earth processes.

These results address the scientific goals of the program, which include providing a global description of geological and geophysical structures and materials, studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations, and studying passive and active continental margins. In addition, the ODP data support the study of sea-level and ocean-circulation changes, the effects of the Earth's orbital variations on climate, and the study of processes and mechanisms of evolution from the biological records in the cores which are recovered from drilling.

The Ocean Drilling Program is a partnership of scientists and governments. Overall scientific policy and management guidance is provided by Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES), which consists of committees and panels made up of representatives of the participating institutions and other scientific and engineering experts. The JOIDES Executive Committee (EXCOM) provides general oversight; the JOIDES Planning Committee (PCOM) is the focal point for all scientific planning for the ODP and is key to the scientific success of the program.

The PCOM has a network of panels and working groups which screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical survey data and other safety and siting information. PCOM uses the recommendations of these panels and committees to select drilling targets, to specify the major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists. The science operator, Texas A&M University, in turn is responsible for planning the detailed ship's operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the cognizant panels.

Many of the scientific goals can be met only with new technology. Thus the program has identified engineering goals, which include the ability to start a hole and to core on bare rock at mid-ocean ridge sites, to drill in high-temperature and corrosive regions typical of hydrothermal areas, and to core in high latitudes with minimum interference from high seas and sea ice. To meet these needs, the program operates a specially equipped drillship, the *JOIDES Resolution*, which contains laboratories and equipment that are state-of-the-art, and carries a major new logging program.

The ship, registered as SEDCO/BP 471 after her owners and her length in feet (144 meters), is 70 feet (21 meters) wide, and has a displacement of 16,595 long tons. Her derrick towers 200 feet (61 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails

with a scientific and technical crew of 50 and a ship's crew of 65.

Logging is a major part of the overall operation. The program provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiwer is available for imaging the well-bore wall, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the well bore, and a vertical seismic profiler records reflectors from below the total depth of the hole.

Texas A&M University serves as science operator for the Ocean Drilling Program. In this capacity, they operate and staff the drillship to collect cores from JOIDES-designated sites from around the world. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and by providing logistical and technical support for shipboard scientific teams. Onshore, Texas A&M manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of the scientific results. Lamont-Doherty Geological Observatory (LDGO) of Columbia University manages the program's logging operations, which include processing the data and provision of assistance to scientists in data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDGO. Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at three sites: ODP Pacific and Indian Ocean cores at Texas A&M University, ODP and DSDP Atlantic and Antarctic cores at Lamont-Doherty Geological Observatory, and DSDP Pacific and Indian Ocean cores at Scripps Institution of Oceanography.

International oversight and coordination are provided by the ODP Council, a governmental consultative body of partner country representatives, chaired by the United States, which periodically reviews the general progress of the program and discusses financial plans and other management issues. Joint Oceanographic Institutions, Inc., a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor and manages the ODP. JOI is responsible for seeing that the scientific objectives and plans are translated into scientific operations consistent with JOIDES recommendations and budgetary constraints.

Scientific achievements of the ODP already include new data on early seafloor spreading and how continents separate and their margins evolve. We have new insight into glacial cycles and the fluctuations of currents throughout geological time. Technical achievements include the first bare-rock coring, and logging data more accurate and complete than ever before. JOI is pleased to have played a facilitating role in the Ocean Drilling Program.

D. James Baker
President
Joint Oceanographic Institutions, Inc.

Washington, D.C.

Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

Scientific Results volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly. A paper that has undergone regular peer review is not eligible for later consideration as a Data Report.

In acknowledgment of the contributions made by this volume's Editorial Review Board, names of the individual Board members are listed on the title page. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

TABLE OF CONTENTS

VOLUME 113 — SCIENTIFIC RESULTS

ACKNOWLEDGMENTS	1
SECTION 1: PETROLOGY	
1. MINERALOGY AND GEOCHEMISTRY OF ALKALI BASALTS FROM MAUD RISE, WEDDELL SEA, ANTARCTICA	5
E. S. Schandl, M. P. Gorton, and F. J. Wicks	
SECTION 2: GEOPHYSICS	
2. HEAT FLOW MEASUREMENTS IN THE WEDDELL SEA, ANTARCTICA: ODP LEG 113	17
T. Nagao	
3. THE RELATIONSHIP BETWEEN SILICA DIAGENESIS, METHANE, AND SEISMIC REFLECTIONS ON THE SOUTH ORKNEY MICROCONTINENT	27
M. J. Lonsdale	
4. WEGENER CANYON BATHYMETRY AND RESULTS FROM ROCK DREDGING NEAR ODP SITES 691–693, EASTERN WEDDELL SEA, ANTARCTICA	39
D. K. Fütterer, G. Kuhn, and H. W. Schenke	
SECTION 3: SEDIMENTOLOGY	
5. PALEOENVIRONMENTS IN THE WEDDELL SEA AREA AND ANTARCTIC CLIMATES AS DEDUCED FROM CLAY MINERAL ASSOCIATIONS AND GEOCHEMICAL DATA, ODP LEG 113	51
C. Robert and H. Maillot	
6. SEDIMENTARY FACIES AND DEPOSITIONAL ENVIRONMENT OF THE LOWER CRETACEOUS EAST ANTARCTIC MARGIN: SITES 692 AND 693	71
S. B. O'Connell	
7. PROVENANCE AND GLACIAL HISTORY OF VERY FINE QUARTZ SAND FROM THE WEDDELL SEA, ANTARCTICA	89
C. H. Smith and S. B. O'Connell	
8. GRAIN SIZE AND DIATOM CONTENT OF HEMIPELAGIC SEDIMENTS AT SITE 697, ODP LEG 113: A RECORD OF PLIOCENE-PLEISTOCENE CLIMATE	111
C. J. Pudsey	
9. OLIGOCENE TO QUATERNARY SEDIMENTATION PROCESSES ON THE ANTARCTIC CONTINENTAL MARGIN, ODP LEG 113, SITE 693	121
H. Grobe, D. K. Fütterer, and V. Spieß	
SECTION 4: GEOCHEMISTRY	
10. MAJOR ELEMENT AND OXYGEN ISOTOPE STUDIES OF INTERSTITIAL WATERS: ODP LEG 113	135
P. K. Egeberg, P. Aagaard, and P. C. Smalley	

11. STRONTIUM ISOTOPE GEOCHEMISTRY OF LEG 113 INTERSTITIAL WATERS AND CARBONATES	147
P. K. Egeberg, P. C. Smalley, and P. Aagaard	
12. GEOCHEMICAL STUDIES OF THE CRETACEOUS/TERTIARY BOUNDARY IN ODP HOLES 689B AND 690C	159
H. V. Michel, F. Asaro, W. Alvarez, and L. W. Alvarez	
13. THE DIAGENETIC FACTORS CONTROLLING THE DISSOLVED ORGANIC CARBON (DOC) IN PORE WATER FROM DEEP SEA SEDIMENTS (ODP LEG 113, WEDDELL SEA)	169
P. K. Egeberg and M. I. Abdullah	
14. AMINO ACIDS IN THE INTERSTITIAL WATERS FROM ODP SITE 695 IN THE WEDDELL SEA, ANTARCTIC OCEAN	179
H. Kawahata, T. Ishizuka, and T. Nagao	
15. INVESTIGATION OF CRETACEOUS AND TERTIARY KEROGENS IN SEDIMENTS OF THE WEDDELL SEA	189
K. F. M. Thompson and W. G. Dow	
16. HYDROCARBONS IN SEDIMENT OF THE WEDDELL SEA, ANTARCTICA	199
K. A. Kvenvolden, F. D. Hostettler, and T. J. Frank	
 SECTION 5: PHYSICAL PROPERTIES AND DOWNHOLE LOGGING	
17. CONSOLIDATION CHARACTERISTICS OF WEDDELL SEA SEDIMENTS: RESULTS OF ODP LEG 113	211
W. R. Bryant and F. R. Rack	
18. THE FABRIC OF A CONSOLIDATING CLAYEY SEDIMENT COLUMN, ODP SITE 697	225
W. R. Bryant, R. H. Bennett, P. J. Burkett, and F. R. Rack	
19. SEDIMENTARY RESPONSE TO PALEOCLIMATE FROM DOWNHOLE LOGS AT SITE 693, ANTARCTIC CONTINENTAL MARGIN	239
X. Golovchenko, S. B. O'Connell, and R. Jarrard	
 SECTION 6: MAGNETOSTRATIGRAPHY	
20. MESOZOIC MAGNETOSTRATIGRAPHY OF MAUD RISE, ANTARCTICA	255
N. Hamilton	
21. CENOZOIC MAGNETOSTRATIGRAPHY OF LEG 113 DRILL SITES, MAUD RISE, WEDDELL SEA, ANTARCTICA	261
V. Spieß	
 SECTION 7: PALEONTOLOGY AND BIOSTRATIGRAPHY	
22. MIDDLE CRETACEOUS PLANKTONIC FORAMINIFERS OF THE ANTARCTIC MARGIN: HOLE 693A, ODP LEG 113	319
R. M. Leckie

CHAPTER 35, FIGS 3, 4: RANGE CHARTS OF SELECTED SPECIES OF BENTHIC FORAMINIFERS AT HOLES 689B AND 690B, EOCENE THROUGH RECENT.

CHAPTER 35, APPENDIX 2, PARTS 1, 2, 3, AND 4: LATE CRETACEOUS THROUGH NEOGENE DEEP-SEA BENTHIC FORAMINIFERS (MAUD RISE, WEDDELL SEA, ANTARCTICA), SITES 689 AND 690.

CHAPTER 43 TABLES 3 AND 5: STRATIGRAPHIC OCCURRENCES OF SELECTED DIATOM SPECIES FROM THE NEOGENE OF HOLES 689B AND 690B.

ACKNOWLEDGMENTS

Drilling at high latitudes in the Antarctic Ocean has long been a major objective of the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES) drilling program. Leg 113 (January-March 1987) of the Ocean Drilling Program (ODP) was the first expedition to drill in the Weddell Sea sector of Antarctica, a remote, ice-infested region presenting unusual operational difficulties. The initial studies, including core descriptions that were made at sea, were described earlier (*Proc. ODP, Init. Reports*, 113). We present here more detailed, comprehensive interpretations of Leg 113 material. Much was discovered, although, as expected, many new questions have been raised. By any standards the expeditions can be considered to have been highly successful. The scientific party has many individuals to thank for their contributions towards this success.

Charles Hanson (ODP Drilling Superintendent) and David Huey (Tool Specialist) showed considerable ingenuity in helping us to obtain quality stratigraphic sequences from the region. The crew of SEDCO/BP 471 under the leadership of Captain Gerard Kuster and Drilling Superintendent Jack Tarbutton did an outstanding job in operating the scientific platform. Captain Peter Messman and the crew of the *Maersk Master* ice-support vessel enriched the expedition and minimized downtime due to iceberg threat.

We thank the ODP technical support staff under the leadership of Bill Mills for their multitude of shipboard tasks carried out in a pleasant spirit of cooperation.

We also thank the members of the JOIDES Advisory panels, especially those that worked on the Southern Ocean Regional Panel, the Sediment and Ocean History Panel, and the Planning Committee, for their efforts in the planning of this and other Antarctic expeditions. We are also indebted to the staff at ODP operational headquarters at Texas A&M University who contributed much to the operational success of this expedition. A large number of funding agencies in the various ODP member countries contributed to this endeavor. Workers in the United States acknowledge grant assistance from JOI-USSAC that assisted with the shore-based research investigations reported herein. JOI-USSAC also provided J. Kennett (Co-Chief Scientist) with additional support to assist with the processing of the many manuscripts in this volume.

The scientific contributions in this volume were reviewed by at least two outside referees. Their efforts have greatly improved the quality of the volume. A listing of these reviewers is provided separately.

The Scientific Party also thanks the ODP publication staff, especially Lona Dearthmont, Jennifer Pattison Hall, Norman Stewart, Diana Kennett, and Amanda Masterson, for their considerable efforts in preparation of the volume for press.
