

6. UNDERWAY GEOPHYSICS¹

Gregory Simmons² and Shipboard Scientific Party³

INTRODUCTION

Geophysical data presented in this chapter were collected during Leg 117 of the Ocean Drilling Program (ODP). *JOIDES Resolution* was underway for 19 days of the 54.5 days at sea, traveling approximately 4310 nmi between Colombo, Sri Lanka, and Port Louis, Mauritius.

Shipboard geophysical instrumentation included two precision echo-sounders, a magnetometer, single channel seismic-reflection profilers, and satellite navigation systems. The instruments were maintained and operated by ODP marine technicians, in cooperation with the scientific party and the officers and crew of SEDCO-FOREX, Inc.

Navigation and bathymetric data, as well as magnetic data, were routinely collected while under way, with coverage in both categories consisting of approximately 91% of the total distance traveled. Seismic reflection data, on the other hand, were generally collected only during surveys while on approach to sites, with coverage consisting of approximately 7% of the total distance traveled.

NAVIGATION

Navigation data were recorded in the Underway Geophysics Lab by a Magnavox-1107 GPS Transit Satellite Receiver. The previous source of raw data, collected on the bridge by a Magnavox-702A-3 Transit Satellite Receiver, was relegated to backup use. The Global Positioning System (GPS) data are preferred over transit satellite and dead-reckoning positions because of the continually updated, higher-quality data available during a GPS "window." This "window" was a period of 4–5 hr each day when positioning data from three or more GPS satellites could be received. Routine collection of navigation data includes recording course and speed data by HIGHRES, the shipboard seismic data acquisition and processing software package.

A plot of the general navigation from Leg 117 is shown in Figure 1. This plot was generated from GPS transit satellite positions, course- and speed-change data, and on- and off-site information compiled from the bridge log, the underway geophysical log, and the HIGHRES tape headers. The Geological Data Center at Scripps Institution of Oceanography produced the navigation compilation (see Appendix). The final site locations are an average of all positions collected while on site.

Site approach surveys were generally carried out during GPS windows; therefore, the information used to reconstruct the ship's track around each drill site is generally GPS data. The sampling density depends on the nature of the survey, generally one fix per 15–30 min in the initial part of the survey, and increasing to one fix per 1–5 min in more critical parts of the survey. The ship's tracks were assumed to proceed from point to

point unless suggested otherwise by course-change information listed in the HIGHRES tape headers. The density of points illustrated in the ship's track reconstructions does not necessarily conform with the amount of data collected, but is sufficient to ensure an accurate reconstruction of the ship's tracks. A number of problems with the Magnavox-1107 GPS Transit Satellite Receiver contributed to the collection of unreliable navigation data during several site approaches; in particular Line 1 on approach to Site 720, Line 3 on approach to Site 723, Line 4 on approach to Sites 724 and 725, Line 6 on approach to Site 727, and Line 8 on approach to Site 730. In these cases the ship's tracks were reconstructed, primarily using two sources of information, namely GPS and transit satellite positions listed on the bridge log, and course and speed information listed in the HIGHRES tape headers.

BATHYMETRIC DATA RECORDING

Bathymetric data were obtained with both 3.5-kHz (Raytheon recorder system) and 12-kHz (EDO-248C recorder system) echo-sounders. Unfortunately, because of poor transducer location, the quality of the recorded data was poor when the ship was traveling at speeds greater than 6 kt. Consequently, site surveys requiring detailed bathymetric data were conducted at speeds slower than 6 kt (see the site chapters, this volume). A total of 3927 nmi of bathymetric data were collected on Leg 117, and a generalized bathymetric profile, along with the magnetic profile, is presented in Figure 2.

MAGNETICS

A Geometrics-801 proton procession magnetometer was used to collect a total of 3910 nmi of magnetic data on Leg 117. A generalized magnetic record compiled by the Geological Data Center at Scripps Institution of Oceanography is presented in Figure 2. The magnetic values were retrieved at approximately 1-nmi spacing, and the regional field was removed using the 1985 International Geomagnetic Reference Field.

SEISMIC REFLECTION PROFILES

The seismic sources used aboard *JOIDES Resolution* during Leg 117 were two synchronized 80-in.³ Seismic System, Inc. water guns operated at approximately 1900 psi. One 100-m-long Teledyne streamer containing 60 active sections, combined to produce a single signal, was deployed from the fantail and towed about 500 m behind the vessel.

Seismic data were displayed in real time in analog format on two EDO-550 dry-paper recorders, using only streamers, amplifier, and band-pass filters (Table 1). Seismic data were also recorded using a Masscomp-561 computer, which functions as the central unit to record, process, and display the data. Data were processed and displayed in real time on a 15-in.-wide Printronix high-resolution graphic printer (160 dots/in.). Raw data were recorded on magnetic tapes, using a SEG-Y format and a density of 1600 bits/in. Seismic lines recorded with the Masscomp were reprocessed at ODP headquarters according to the parameters listed in Table 2. The final data were displayed on a 22-in.-wide Versatec plotter (200 dots/in.).

³ Shipboard Scientific Party is as given in the list of Participants preceding the contents.

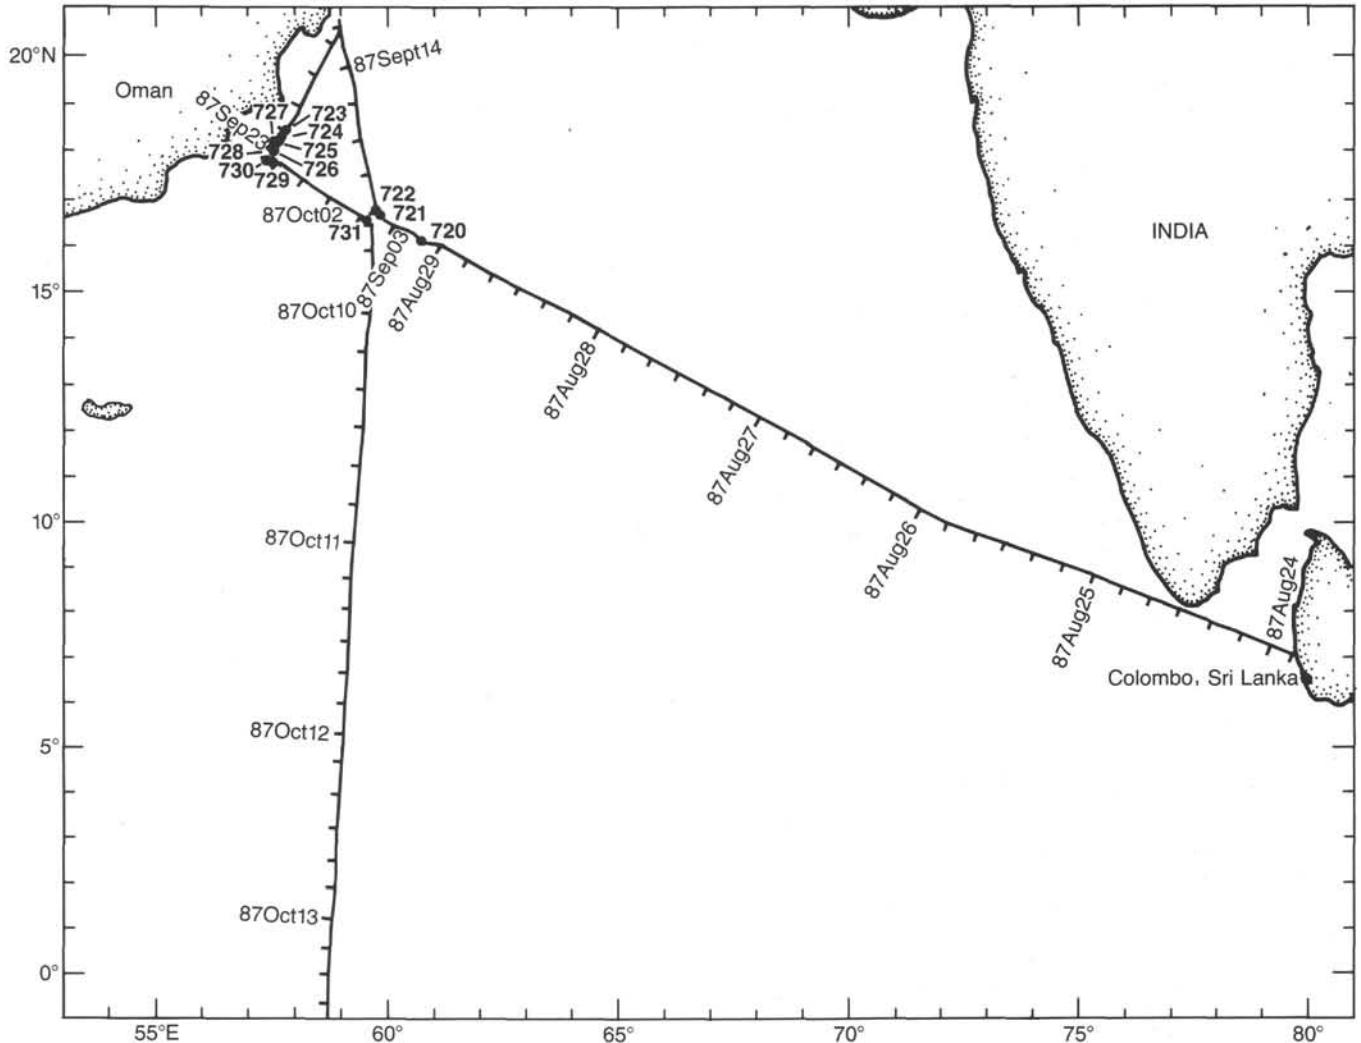

Figure 1. General navigation and site location plot for Leg 117, generated from satellite, course-, and speed-change data given in the Appendix. Detailed ship's tracks for seismic lines/site approaches are shown on Figures 3, 5, 8, 10, 12, 14, 16, 18, and 21.

We recorded nine seismic lines during Leg 117, covering approximately 290 nmi. These profiles are available from the ODP Data Base Supervisor.

1. Seismic line 1 was collected on the approach to Site 720 along the track shown in Figure 3. The processed digital seismic profile is shown in Figure 4 (from Julian Day 241/0241 UTC/shotpoint 4988 to Julian Day 241/0549 UTC/shotpoint 5928).

2. Seismic line 2 was collected en route to and on approach to Sites 721 and 722. While en route to the sites a problem was discovered in collection of digital data, and the line is therefore broken into three parts, line 2A consisting of the processed digital data collected before the problem occurred, line 2B consisting of the analog records collected during the absence of digital data, and line 2C consisting of the processed digital data collected after the problem was corrected. Lines 2A and 2B were collected en route to Sites 721 and 722 along the track shown in Figure 5. The processed digital and analog seismic profiles are shown in Figure 6 (from Julian Day 245/1736 UTC/shotpoint 100 to Julian Day 245/2016 UTC/shotpoint 900) and Figure 7 (from Julian Day 245/2016 UTC/shotpoint 900 to Julian Day

246/0212 UTC/shotpoint 2683), respectively. Line 2C was collected on approach to Sites 721 and 722 along the track shown in Figure 8. The processed digital seismic profile is shown in Figure 9 (from Julian Day 246/0212 UTC/shotpoint 2683 to Julian Day 246/0708 UTC/shotpoint 4160).

3. Seismic line 3 was collected on approach to Site 723 along the track shown in Figure 10. The processed digital seismic profile is shown in Figure 11 (from Julian Day 258/0356 UTC/shotpoint 1863 to Julian Day 258/0554 UTC/shotpoint 2636).

4. Seismic line 4 was collected en route to and on approach to Sites 724 and 725 along the track shown in Figure 12. The processed digital seismic profile is shown in Figure 13 (from Julian Day 262/2052 UTC/shotpoint 23 to Julian Day 263/0535 UTC/shotpoint 2635).

5. Seismic line 5 was collected en route to and on approach to Site 726 along the track shown in Figure 14. The processed digital seismic profile is shown in Figure 15 (from Julian Day 265/2040 UTC/shotpoint 1 to Julian Day 266/0438 UTC/shotpoint 2391).

6. Seismic line 6 was collected en route to and on approach to Site 727 along the track shown in Figure 16. The processed

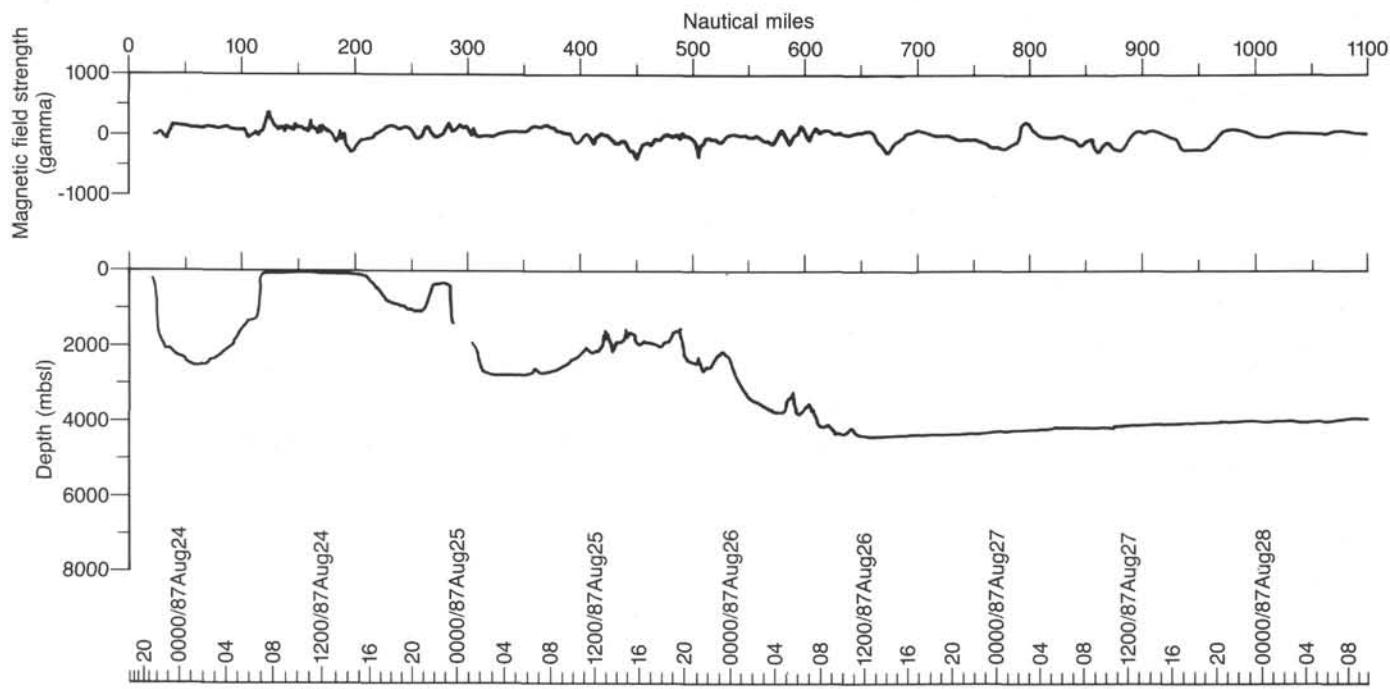

Figure 2. Records of magnetic and bathymetric profiles obtained during Leg 117. Solid bars indicate seismic-reflection coverage. Bottom horizontal scale indicates date and time in hours.

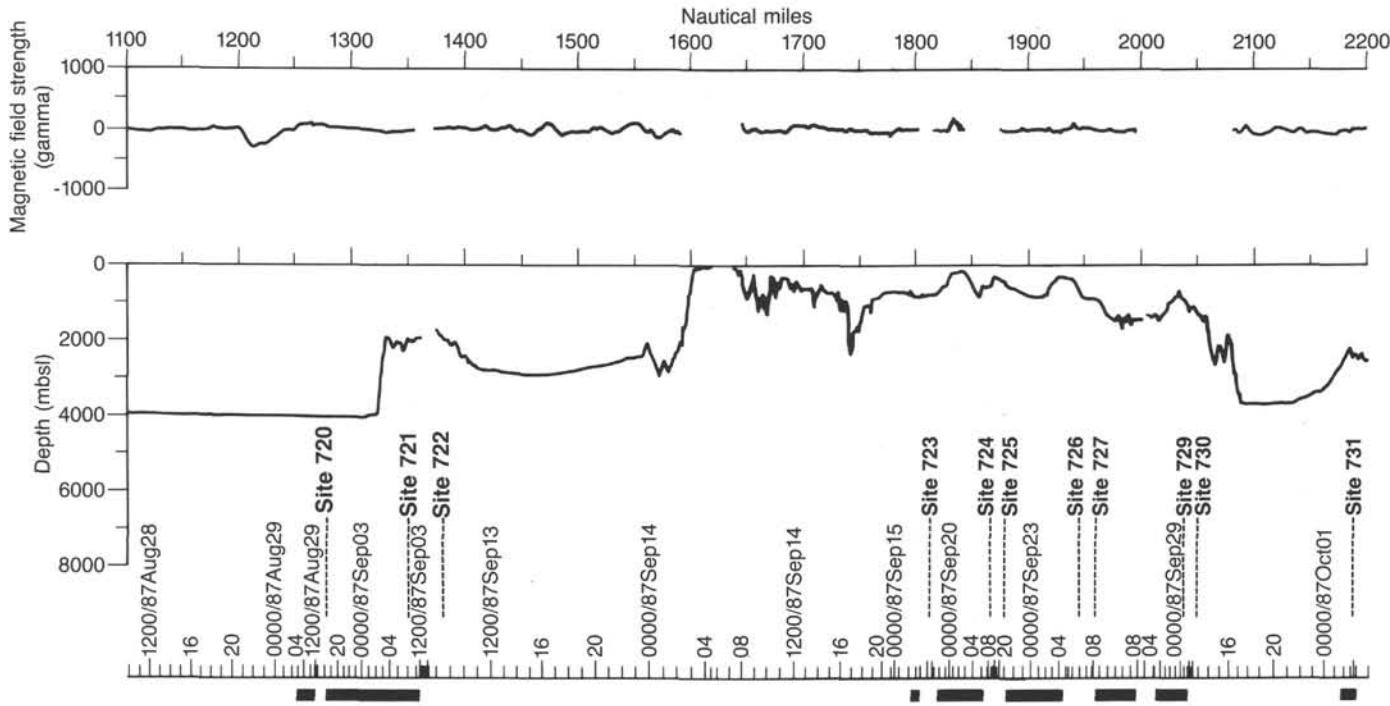

Figure 2 (continued).

digital seismic profile is shown in Figure 17 (from Julian Day 267/0448 UTC/shotpoint 1 to Julian Day 267/0730 UTC/shotpoint 812).

7. Seismic line 7 was collected en route to and on approach to Sites 728 and 729 along the track shown in Figure 18. Because of its close association, the track for line 8 is also shown

in Figure 18. The processed digital seismic profile for line 7 is shown in Figure 19 (from Julian Day 268/0225 UTC/shotpoint 1 to Julian Day 268/0740 UTC/shotpoint 1579).

8. Seismic line 8 was collected en route to and on approach to Site 730 along one of the tracks shown in Figure 18. The processed digital seismic profile is shown in Figure 20 (from Julian

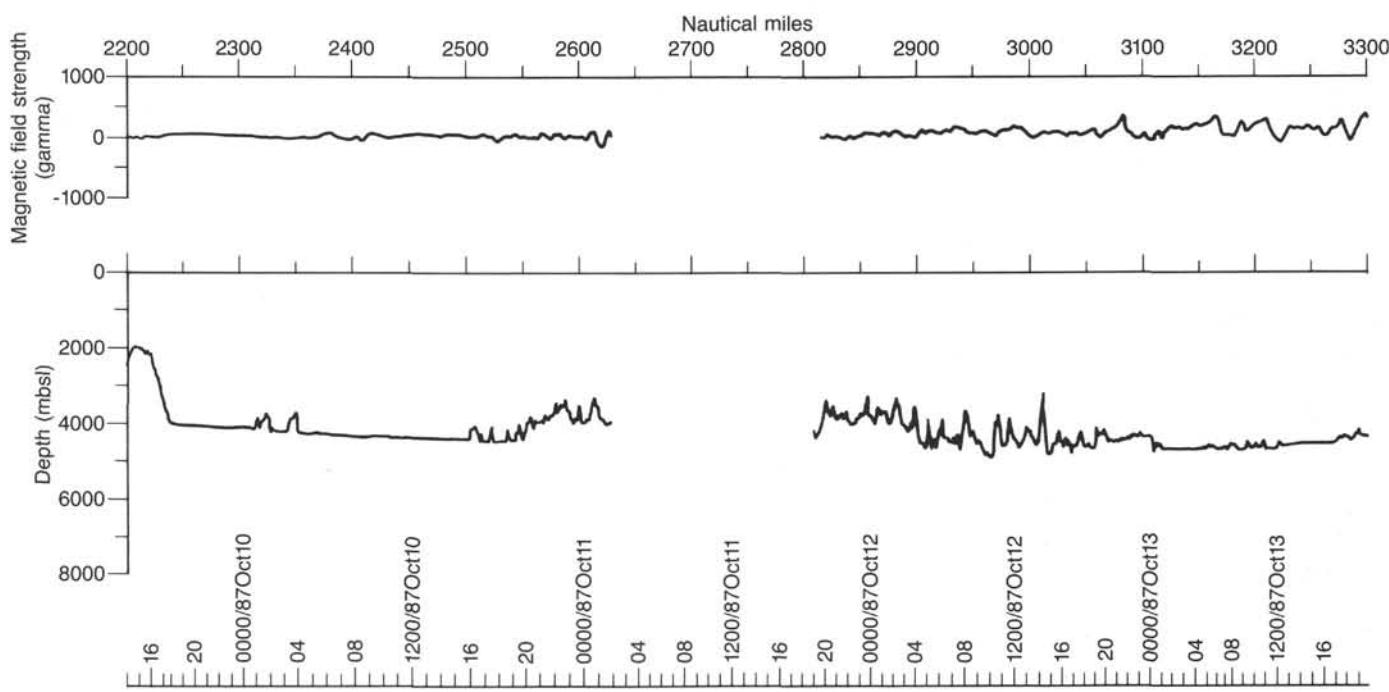

Figure 2 (continued).

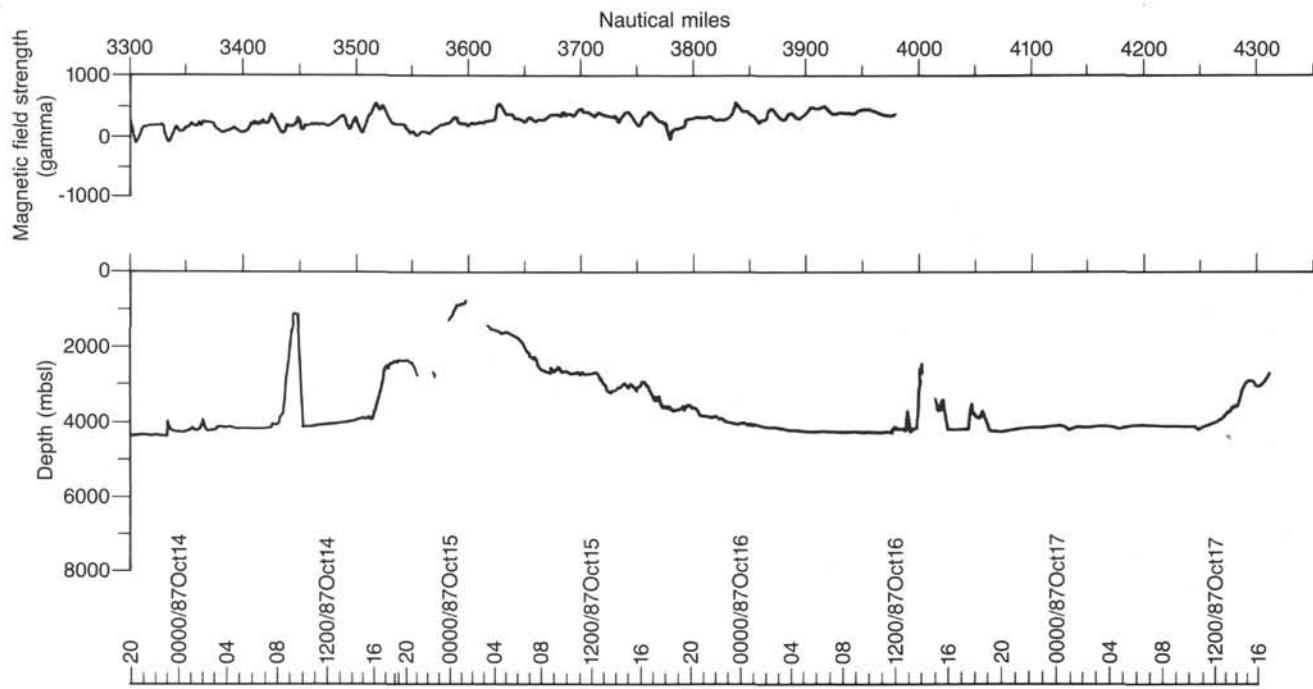

Figure 2 (continued).

Day 271/1855 UTC/shotpoint 1 to Julian Day 272/0208 UTC/shotpoint 2165).

9. Seismic line 9 was collected on approach to Site 731 along the track shown in Figure 21. The processed digital seismic profile is shown in Figure 22 (from Julian Day 274/

0148 UTC/shotpoint 595 to Julian Day 274/0337 UTC/shotpoint 1135).
