Prepared by the
OCEAN DRILLING PROGRAM
Texas A&M University

Norman J. Stewart
Volume Editor

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Department of Energy, Mines and Resources (Canada)

Deutsche Forschungsgemeinschaft (Federal Republic of Germany)

European Science Foundation Consortium for the Ocean Drilling Program (Belgium, Denmark, Finland, Iceland, Italy, Greece, the Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)

Institut Français de Recherche pour l'Exploitation de la Mer (France)

National Science Foundation (United States)

Natural Environment Research Council (United Kingdom)

University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

It is recommended that reference to the whole or to part of this volume be made in one of the following forms, as appropriate:

Prell, W. L., Niitsuma, N., et al., 1991. *Proc. ODP, Sci. Results*, 117: College Station, TX (Ocean Drilling Program).

Pedersen, T. F., and Shimmield, G. B., 1991. Interstitial water chemistry, Leg 117: Contrasts with the Peru Margin. In Prell, W. L., Niitsuma, N., et al., *Proc. ODP, Sci. Results*, 117: College Station, TX (Ocean Drilling Program), 499–513.

Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is the correct one.

The mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 127 (*Initial Reports*): September 1990

Volume 128 (*Initial Reports*): September 1990

Volume 129 (*Initial Reports*): December 1990

Volume 114 (*Scientific Results*): February 1991

Volume 115 (*Scientific Results*): September 1990

Volume 116 (*Scientific Results*): September 1990

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Foreword

By the National Science Foundation

The scientists of the Ocean Drilling Program (ODP) have embarked on what could prove to be one of the most important earth science initiatives of the decade—an initiative rivaling in scope and impact the exploration of the frontiers of outer space. The program explores our planet's last frontier—the Earth's structure and history as it is revealed beneath the oceans. The scope of the program's scientific goals excites the imagination, challenges the intellect, and enhances the spirit of cooperation among peoples in countries around the world.

Between 1872 and 1876, HMS *Challenger* undertook the world's first major oceanographic expedition. That expedition greatly expanded man's knowledge of the world's oceans and revolutionized our ideas about planet Earth. From 1968 to 1983, another ship named *Challenger* logged more than 375,000 miles on 96 voyages across every ocean for the Deep Sea Drilling Project (DSDP), operated by Scripps Institution of Oceanography. Among the project's many remarkable discoveries were the confirmation of seafloor spreading and the establishment of the relative youth of the seafloor, thus verifying the dynamic and changing nature of the Earth's crust.

Today, the Ocean Drilling Program, which began in 1983, brings new resources to bear on scientific ocean drilling. A new drillship is in operation—the *JOIDES Resolution*—one of the world's most modern and best equipped drillships with enhanced capability for drilling and coring in polar areas and rough weather, expanded laboratory space, facilities for more scientists, and a major drill-hole logging program. The name of the ship was derived from the international scientific partnership that directs the program—the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES)—and from the flagship of Captain Cook's second voyage to the Pacific Ocean in the late 18th century. Texas A&M University is responsible for science operations in the program, and Lamont-Doherty Geological Observatory is responsible for the logging program.

The Ocean Drilling Program truly has international participation. In 1975, the International Phase of Ocean Drilling began with member nations—the U.S.A., U.S.S.R., Federal Republic of Germany, Japan, United Kingdom, and France—all providing funds and scientific guidance for the project. Today, ODP partners include the U.S.A., the Canada/Australia Consortium for the Ocean Drilling Program, France, the Federal Republic of Germany, Japan, the United Kingdom, and the European Science Foundation, which represents Sweden, Finland, Norway, Iceland, Denmark, Belgium, the Netherlands, Spain, Swit-

zerland, Italy, Greece, and Turkey. The National Science Foundation, with funds contributed by the United States and international partners, supports the scientific operations and planning for the ODP through a contract with Joint Oceanographic Institutions, Inc. (JOI).

The information gained by the program leads to a better understanding of the Earth and its dynamic processes. Drilled sediment cores and logs reveal clues to past climatic history and tie into parallel studies of paleoclimates from glacial ice cores drilled on the continents. Understanding these sediment cores will enable scientists to complete the map of major geologically active regions of the Earth, and to identify processes that lead to dynamic change such as earthquakes, volcanic eruptions, and mountain and continental growth. We are far from being able to predict such changes accurately now; but with the new tools and understanding, the accuracy of such predictions can be improved. This better understanding of the Earth's system(s) will allow us to identify regions of potential mineral and energy resource development, an issue of worldwide human interest. The Ocean Drilling Program is not in itself aimed at finding resources, but the knowledge of the Earth's processes that is gained through such a basic research program will inevitably provide pieces of information required for such resource discovery and exploitation.

The program is fully under way in its aim to further the understanding of the Earth's dynamic systems. People of our planet will benefit directly and indirectly from this research in both their daily living and work activities. This multinational endeavor will perhaps foster other cooperative efforts in science or among societies. The Ocean Drilling Program has distinguished ancestors in the original *Resolution* and *Challenger* expeditions and the Deep Sea Drilling Project. The National Science Foundation is proud to be playing a leading role in this program, and we are looking forward to significant and innovative science for many years to come.

Erich Bloch
Director
National Science Foundation

Washington, D.C.

Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents results from the Ocean Drilling Program (ODP), where scientists use a specially equipped ocean drilling ship to sample and measure the properties of the submerged part of the Earth's crust. These data are then synthesized with other information to yield new insights into earth processes.

These results address the scientific goals of the program, which include providing a global description of geological and geophysical structures and materials, studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations, and studying passive and active continental margins. In addition, the ODP data support the study of sea-level and ocean-circulation changes, the effects of the Earth's orbital variations on climate, and the study of processes and mechanisms of evolution from the biological records in the cores which are recovered from drilling.

The Ocean Drilling Program is a partnership of scientists and governments. Overall scientific policy and management guidance is provided by Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES), which consists of committees and panels made up of representatives of the participating institutions and other scientific and engineering experts. The JOIDES Executive Committee (EXCOM) provides general oversight; the JOIDES Planning Committee (PCOM) is the focal point for all scientific planning for the ODP and is key to the scientific success of the program.

The PCOM has a network of panels and working groups which screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical survey data and other safety and siting information. PCOM uses the recommendations of these panels and committees to select drilling targets, to specify the major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists. The science operator, Texas A&M University, in turn is responsible for planning the detailed ship's operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the cognizant panels.

Many of the scientific goals can be met only with new technology. Thus the program has identified engineering goals, which include the ability to start a hole and to core on bare rock at mid-ocean-ridge sites, to drill in high-temperature and corrosive regions typical of hydrothermal areas, and to core in high latitudes with minimum interference from high seas and sea ice. To meet these needs, the program operates a specially equipped drillship, the *JOIDES Resolution*, which contains laboratories and equipment that are state-of-the-art, and carries a major new logging program.

The ship, registered as SEDCO/BP 47 after her owners and her length in feet (144 meters), is 70 feet (21 meters) wide, and has a displacement of 16,595 long tons. Her derrick towers 200 feet (61 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 50 and a ship's crew of 65.

Logging is a major part of the overall operation. The program provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiewer is available for imaging the well-bore wall, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the well bore, and a vertical seismic profiler records reflectors from below the total depth of the hole.

Texas A&M University serves as science operator for the Ocean Drilling Program. In this capacity, they operate and staff the drillship to collect cores from JOIDES-designated sites from around the world. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and by providing logistical and technical support for shipboard scientific teams. Onshore, Texas A&M manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of the scientific results. Lamont-Doherty Geological Observatory (LDGO) of Columbia University manages the program's logging operations, which include processing the data and provision of assistance to scientists in data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDGO. Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at three sites: ODP Pacific and Indian Ocean cores at Texas A&M University, ODP and DSDP Atlantic and Antarctic cores at Lamont-Doherty Geological Observatory, and DSDP Pacific and Indian Ocean cores at Scripps Institution of Oceanography.

International oversight and coordination are provided by the ODP Council, a governmental consultative body of partner country representatives, chaired by the United States, which periodically reviews the general progress of the program and discusses financial plans and other management issues. Joint Oceanographic Institutions, Inc., a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor and manages the ODP. JOI is responsible for seeing that the scientific objectives and plans are translated into scientific operations consistent with JOIDES recommendations and budgetary constraints.

Scientific achievements of the ODP already include new data on early seafloor spreading and how continents separate and their margins evolve. We have new insight into glacial cycles and the fluctuations of currents throughout geological time. Technical achievements include the first bare-rock coring, and logging data more accurate and complete than ever before. JOI is pleased to have played a facilitating role in the Ocean Drilling Program.

D. James Baker
President

Washington, D.C.

Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

Scientific Results volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly. A paper that has undergone regular peer review is not eligible for later consideration as a Data Report.

In acknowledgment of the contributions made by this volume's Editorial Review Board, names of the individual Board members are listed on the title page. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

TABLE OF CONTENTS

VOLUME 117—SCIENTIFIC RESULTS

Acknowledgments	1
---------------------------	---

SECTION 1: BIO/LITHO/MAGNETOSTRATIGRAPHY

1. Neogene nannofossil biostratigraphy of Sites 723 through 730, Oman Continental Margin, northwestern Arabian Sea	5
S. Spaulding	
2. Coccolith biostratigraphy of the Arabian Sea	37
T. Sato, K. Kameo, and T. Takamaya	
3. The benthic foraminiferal faunas of Sites 725, 726, and 728 (Oman Margin, northwestern Arabian Sea)	55
J.O.R. Hermelin	
4. Composition and biostratigraphy of radiolarian assemblages from an area of upwelling (northwestern Arabian Sea, Leg 117)	89
C. Nigrini	
5. Magnetostratigraphic and biostratigraphic synthesis, Leg 117, Arabian Sea	127
S. A. Spaulding, J. Bloemendal, A. Hayashida, J.O.R. Hermelin, K. Kameo, D. Kroon, C. A. Nigrini, T. Sato, T.N.F. Steens, T. Takayama, and S. R. Troelstra	
6. Layer-by-layer correlation of drilled sediments from Owen Ridge, Oman Margin, and Indus Fan	147
N. Niitsuma	
7. Magnetostratigraphy of Leg 117 sediments from the Owen Ridge and the Oman Margin, western Arabian Sea	161
A. Hayashida and J. Bloemendal	

SECTION 2: SEDIMENTOLOGY

8. Clay mineralogy of Neogene sediments of the western Arabian Sea: mineral abundances and paleoenvironmental implications	183
P. Debrabant, L. Krissek, A. Bouquillon, and H. Chamley	
9. Mineralogic variations in a Pleistocene high-resolution eolian record from the Owen Ridge, western Arabian Sea (Site 722): implications for sediment source conditions and monsoon history	197
L. A. Krissek and S. C. Clemens	
10. Mud turbidites from the Oligocene and Miocene Indus Fan at Sites 722 and 731 on the Owen Ridge	215
G. P. Weedon and I. N. McCave	
11. Burial transformation of sediment fabric at sites in the western Arabian Sea	221
J. S. Callaway and W. H. Busch	
12. Analysis of wet-bulk density and sediment color cycles in Pliocene-Pleistocene sediments of the Owen Ridge (Site 722) and Oman Margin (Site 728)	239
W. H. Busch	

SECTION 3: PALEOCEANOGRAPHY

13. Onset of monsoonal related upwelling in the western Arabian Sea as revealed by planktonic foraminifers	257
D. Kroon, T.N.F. Steens, and S. R. Troelstra	
14. Coastal upwelling gradient during the late Pleistocene	265
D. M. Anderson and W. L. Prell	
15. Pollen transport into Arabian Sea sediments	277
E. Van Campo	
16. A pollen analysis of the Indus Deep Sea Fan from Site 720 cores	283
Y. Yoshinori, N. Niitsuma, and A. Hayashida	
17. Late Pleistocene evolution of surface and mid-depth hydrography at the Oman Margin: planktonic and benthic isotope records at Site 724	291
R. Zahn and T. F. Pedersen	
18. Late Pleistocene periodicities of oxygen isotope ratios, calcium carbonate contents, and magnetic susceptibilities of western Arabian Sea Margin Hole 728A	309
T.N.F. Steens, D. Kroon, W. G. ten Kate, and A. Sprenger	
19. Oxygen and carbon isotope stratigraphy at Site 723, Oman Margin	321
N. Niitsuma, T. Oba, and M. Okada	
20. Pliocene to Pleistocene variations in calcium carbonate, organic carbon, and opal on the Owen Ridge, northern Arabian Sea	343
D. W. Murray and W. L. Prell	
21. One million year record of summer monsoon winds and continental aridity from the Owen Ridge (Site 722), northwest Arabian Sea	365
S. C. Clemens and W. L. Prell	
22. A rock-magnetic record of monsoonal dust deposition to the Arabian Sea: evidence for a shift in the mode of deposition at 2.4 Ma	389
P. de Menocal, J. Bloemendal, and J. King	
23. The inorganic geochemical record of the northwest Arabian Sea: a history of productivity variation over the last 400 k.y. from Sites 722 and 724	409
G. B. Shimmield and S. R. Mowbray	
24. Late Pleistocene upwelling and productivity variations in the northwest Indian Ocean deduced from spectral analyses of geochemical data from Sites 722 and 724	431
G. P. Weedon and G. B. Shimmield	
25. Late Pleistocene sea surface water temperature variations off Oman as revealed by the distribution of long-chain alkenones	445
H. L. ten Haven and D. Kroon	

SECTION 4. INORGANIC GEOCHEMISTRY

26. ^{10}Be contents of late Cenozoic sediments from Sites 720, 722, and 728 in the western Arabian Sea	455
C. J. Beets, G. T. Klaver, D. Kroon, K. van den Borg, and A. F. de Jong	
27. The late Neogene $^{87}\text{Sr}/^{86}\text{Sr}$ isotopic record in the western Arabian Sea, Site 722	459
C. J. Beets	
28. U-series disequilibrium, particle scavenging, and sediment accumulation during the late Pleistocene on the Owen Ridge, Site 722	465
G. B. Shimmield and S. R. Mowbray	

29. High-resolution geochemical variations at Sites 723, 728, and 731: a comparison of X-ray fluorescence and geochemical logs	473
R. D. Jarrard and M. Lyle	
30. Interstitial water chemistry, Leg 117: contrasts with the Peru Margin	499
T. F. Pedersen and G. B. Shimmield	

SECTION 5. ORGANIC GEOCHEMISTRY

31. Organic carbon, reduced sulfur, and iron in Miocene to Holocene upwelling sediments from the Oman and Benguela upwelling systems	517
K.-C. Emeis, J. W. Morse, and L. L. Mays	
32. Organic compounds in sediments and pore waters of Sites 723 and 724	529
R. Seifert and W. Michaelis	
33. Pyrolytic character of organic matter in Cenozoic sediments on the Oman shelf	547
K.-C. Emeis and J. K. Whelan	
34. Preliminary lipid analysis of sediments recovered during Leg 117	561
H. L. ten Haven and J. Rullkötter	
35. Stable carbon and nitrogen isotope compositions of organic matter from Sites 724 and 725, Oman Margin	571
A.N.N. Muzuka, S. A. Macko, and T. F. Pedersen	
36. Organic petrology of Neogene sediments from north Indian Ocean, Leg 117: Amount, type, and preservation of organic matter	587
P. Bertrand, E. Lallier-Verges, and H. Grall	

SECTION 6. POLICY

JOIDES advisory groups	597
Sample-Distribution Policy	603

SECTION 7. INDEX

Index	607

ACKNOWLEDGMENTS

The scientists of Leg 117 (Colombo to Mauritius) dedicate this volume to the memory of Lamar Hayes, ODP Operations Superintendent. Lamar's intense interest in recovering more and better preserved sediments and his calm demeanor during the frantic shallow-water drilling operations in offshore Oman were key ingredients in the success of Leg 117. We thank Captain Gerard Kuster, SEDCO Drilling Superintendent Jack Tarbutton, and their crew for their enthusiastic and efficient cooperation with the scientific crew. They helped make Leg 117 both memorable and successful. The entire scientific crew greatly appreciated the professional and friendly help of ODP Laboratory Officer Brad Julson and the ODP technicians, who maintained great spirit and high working standards throughout the entire leg.

All of the scientists and contributors to this volume greatly appreciate the help and patience of our ODP Publications Coordinator, Janalisa Soltis, the editors, and the art group during the review and preparation of the volume.

We gratefully acknowledge USSAC and other national ODP programs for funding the scientists' participation in Leg 117 and for the JOIDES advisory structure for the opportunity to present our proposal to drill the Arabian Sea Upwelling Zone and, in particular, the endorsements of the Sediment and Ocean History Panel (SOHP) and the Indian Ocean Panel (IOP), as well as the tolerance of the Lithosphere Panel (LITHP) and the Tectonics Panel (TECP) in the planning phase.

Lastly, we thank Senator Claiborne Pell for interceding on our behalf to operate in the waters of the Sultanate of Oman. We greatly acknowledge the permission given by the Sultanate of Oman to conduct our program of scientific drilling on the continental margin of Oman.
