

A. Laminated calcareous claystone, 15 cm-thick, at the Cretaceous/Tertiary boundary in Section 738C-20R-5 from the southern Kerguelen Plateau. Arrow points to 2-mm-thick clay layer enriched in iridium. **B.** Massive diamictite of early Oligocene age from Section 739C-40R-1 from the Prydz Bay continental shelf. These and other glacial sediments recovered in Prydz Bay are evidence of extensive Antarctic glaciation in early Oligocene, and possibly late Eocene, time.

Prepared by the
OCEAN DRILLING PROGRAM
TEXAS A&M UNIVERSITY

Elsa Kapitan Mazzullo and Norman J. Stewart
Volume Editors

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Department of Energy, Mines and Resources (Canada)

Deutsche Forschungsgemeinschaft (Federal Republic of Germany)

European Science Foundation Consortium for Ocean Drilling (Belgium, Denmark, Finland, Iceland, Italy, Greece, the Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)

Institut Français de Recherche pour l'Exploitation de la Mer (France)

National Science Foundation (United States)

Natural Environment Research Council (United Kingdom)

University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

It is recommended that reference to the whole or to part of this volume be made in one of the following forms, as appropriate:

Barron, J., Larsen, B., et al., 1991. *Proc. ODP, Sci. Results*, 119: College Station, TX (Ocean Drilling Program).

Keating, B. H., and Sakai, H., 1991. Magnetostratigraphic studies of sediments from Site 744, southern Kerguelen Plateau. *In* Barron, J., Larsen, B., et al., *Proc. ODP, Sci. Results*, 119: College Station, TX (Ocean Drilling Program), 771-794.

Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is the correct one.

The mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 129 (*Initial Reports*): December 1990
Volume 130 (*Initial Reports*): March 1991
Volume 131/132 (*Initial Reports*): June 1991
Volume 116 (*Scientific Results*): September 1990
Volume 117 (*Scientific Results*): February 1991
Volume 118 (*Scientific Results*): July 1991

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Foreword

By the National Science Foundation

The scientists of the Ocean Drilling Program (ODP) have embarked on what could prove to be one of the most important earth science initiatives of the decade—an initiative rivaling in scope and impact the exploration of the frontiers of outer space. The program explores our planet's last frontier—the Earth's structure and history as it is revealed beneath the oceans. The scope of the program's scientific goals excites the imagination, challenges the intellect, and enhances the spirit of cooperation among peoples in countries around the world.

Between 1872 and 1876, HMS *Challenger* undertook the world's first major oceanographic expedition. That expedition greatly expanded man's knowledge of the world's oceans and revolutionized our ideas about planet Earth. From 1968 to 1983, another ship named *Challenger* logged more than 375,000 miles on 96 voyages across every ocean for the Deep Sea Drilling Project (DSDP), operated by Scripps Institution of Oceanography. Among the project's many remarkable discoveries were the confirmation of seafloor spreading and the establishment of the relative youth of the seafloor, thus verifying the dynamic and changing nature of the Earth's crust.

Today, the Ocean Drilling Program, which began in 1983, brings new resources to bear on scientific ocean drilling. A new drillship is in operation—the *JOIDES Resolution*—one of the world's most modern and best equipped drillships with enhanced capability for drilling and coring in polar areas and rough weather, expanded laboratory space, facilities for more scientists, and a major drill-hole logging program. The name of the ship was derived from the international scientific partnership that directs the program—the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES)—and from the flagship of Captain Cook's second voyage to the Pacific Ocean in the late 18th century. Texas A&M University is responsible for science operations in the program, and Lamont-Doherty Geological Observatory is responsible for the logging program.

The Ocean Drilling Program truly has international participation. In 1975, the International Phase of Ocean Drilling began with member nations—the U.S.A., U.S.S.R., Federal Republic of Germany, Japan, United Kingdom, and France—all providing funds and scientific guidance for the project. Today, ODP partners include the U.S.A., the Canada/Australia Consortium for the Ocean Drilling Program, France, the Federal Republic of Germany, Japan, the United Kingdom, and the European Science Foundation, which represents Sweden, Finland, Norway, Iceland, Denmark, Belgium, the Netherlands, Spain, Swit-

zerland, Italy, Greece, and Turkey. The National Science Foundation, with funds contributed by the United States and international partners, supports the scientific operations and planning for the ODP through a contract with Joint Oceanographic Institutions, Inc. (JOI).

The information gained by the program leads to a better understanding of the Earth and its dynamic processes. Drilled sediment cores and logs reveal clues to past climatic history and tie into parallel studies of paleoclimates from glacial ice cores drilled on the continents. Understanding these sediment cores will enable scientists to complete the map of major geologically active regions of the Earth, and to identify processes that lead to dynamic change such as earthquakes, volcanic eruptions, and mountain and continental growth. We are far from being able to predict such changes accurately now; but with the new tools and understanding, the accuracy of such predictions can be improved. This better understanding of the Earth's system(s) will allow us to identify regions of potential mineral and energy resource development, an issue of worldwide human interest. The Ocean Drilling Program is not in itself aimed at finding resources, but the knowledge of the Earth's processes that is gained through such a basic research program will inevitably provide pieces of information required for such resource discovery and exploitation.

The program is fully under way in its aim to further the understanding of the Earth's dynamic systems. People of our planet will benefit directly and indirectly from this research in both their daily living and work activities. This multinational endeavor will perhaps foster other cooperative efforts in science or among societies. The Ocean Drilling Program has distinguished ancestors in the original *Resolution* and *Challenger* expeditions and the Deep Sea Drilling Project. The National Science Foundation is proud to be playing a leading role in this program, and we are looking forward to significant and innovative science for many years to come.

Erich Bloch
Director
National Science Foundation

Washington, D.C.

Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents results from the Ocean Drilling Program (ODP), where scientists use a specially equipped ocean drilling ship to sample and measure the properties of the submerged part of the Earth's crust. These data are then synthesized with other information to yield new insights into earth processes.

These results address the scientific goals of the program, which include providing a global description of geological and geophysical structures and materials, studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations, and studying passive and active continental margins. In addition, the ODP data support the study of sea-level and ocean-circulation changes, the effects of the Earth's orbital variations on climate, and the study of processes and mechanisms of evolution from the biological records in the cores which are recovered from drilling.

The Ocean Drilling Program is a partnership of scientists and governments. Overall scientific policy and management guidance is provided by Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES), which consists of committees and panels made up of representatives of the participating institutions and other scientific and engineering experts. The JOIDES Executive Committee (EXCOM) provides general oversight; the JOIDES Planning Committee (PCOM) is the focal point for all scientific planning for the ODP and is key to the scientific success of the program.

The PCOM has a network of panels and working groups which screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical survey data and other safety and siting information. PCOM uses the recommendations of these panels and committees to select drilling targets, to specify the major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists. The science operator, Texas A&M University, in turn is responsible for planning the detailed ship's operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the cognizant panels.

Many of the scientific goals can be met only with new technology. Thus the program has identified engineering goals, which include the ability to start a hole and to core on bare rock at mid-ocean-ridge sites, to drill in high-temperature and corrosive regions typical of hydrothermal areas, and to core in high latitudes with minimum interference from high seas and sea ice. To meet these needs, the program operates a specially equipped drillship, the *JOIDES Resolution*, which contains laboratories and equipment that are state-of-the-art, and carries a major new logging program.

The ship, registered as SEDCO/BP 47 after her owners and her length in feet (144 meters), is 70 feet (21 meters) wide, and has a displacement of 16,595 long tons. Her derrick towers 200 feet (61 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 50 and a ship's crew of 65.

Logging is a major part of the overall operation. The program provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiwer is available for imaging the well-bore wall, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the well bore, and a vertical seismic profiler records reflectors from below the total depth of the hole.

Texas A&M University serves as science operator for the Ocean Drilling Program. In this capacity, they operate and staff the drillship to collect cores from JOIDES-designated sites from around the world. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and by providing logistical and technical support for shipboard scientific teams. Onshore, Texas A&M manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of the scientific results. Lamont-Doherty Geological Observatory (LDGO) of Columbia University manages the program's logging operations, which include processing the data and provision of assistance to scientists in data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDGO. Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at three sites: ODP Pacific and Indian Ocean cores at Texas A&M University, ODP and DSDP Atlantic and Antarctic cores at Lamont-Doherty Geological Observatory, and DSDP Pacific and Indian Ocean cores at Scripps Institution of Oceanography.

International oversight and coordination are provided by the ODP Council, a governmental consultative body of partner country representatives, chaired by the United States, which periodically reviews the general progress of the program and discusses financial plans and other management issues. Joint Oceanographic Institutions, Inc., a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor and manages the ODP. JOI is responsible for seeing that the scientific objectives and plans are translated into scientific operations consistent with JOIDES recommendations and budgetary constraints.

Scientific achievements of the ODP already include new data on early seafloor spreading and how continents separate and their margins evolve. We have new insight into glacial cycles and the fluctuations of currents throughout geological time. Technical achievements include the first bare-rock coring, and logging data more accurate and complete than ever before. JOI is pleased to have played a facilitating role in the Ocean Drilling Program.

Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

Scientific Results volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly.

In acknowledgment of the contributions made by this volume's Editorial Review Board, names of the individual Board members are listed on the title page. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

TABLE OF CONTENTS

VOLUME 119 — SCIENTIFIC RESULTS

Acknowledgments	1
---------------------------	---

SECTION 1: PRYDZ BAY STRATIGRAPHY AND SEDIMENTOLOGY

1. Seismic stratigraphy and structure of Prydz Bay, Antarctica: implications from Leg 119 drilling	5
A. Cooper, H. Stagg, and E. Geist	
2. Sonobuoy seismic studies at ODP drill sites in Prydz Bay, Antarctica	27
G. R. Cochrane and A. K. Cooper	
3. Depositional environment and petrography of preglacial continental sediments from Hole 740A, Prydz Bay, Antarctica	45
B. R. Turner	
4. Lower Cretaceous coal-bearing sediments from Prydz Bay, East Antarctica	57
B. R. Turner and D. Padley	
5. Structure and dynamics of the Lambert Glacier–Amery Ice Shelf system: implications for the origin of Prydz Bay sediments	61
M. J. Hambrey	
6. Cenozoic glacial record of the Prydz Bay Continental Shelf, East Antarctica	77
M. J. Hambrey, W. U. Ehrmann, and B. Larsen	
7. Sedimentary and metamorphic rock clasts from the Cenozoic diamictons of Sites 738–743 in Prydz Bay, East Antarctica	133
C. J. Jenkins and C. Alibert	
8. Geotechnical properties of glacial shelf sediments from Prydz Bay, East Antarctica	143
A. Solheim, C. F. Forsberg, and A. Pittenger	
9. Stepwise consolidation of glacial sediments related to the glacial history of Prydz Bay, East Antarctica	169
A. Solheim, C. F. Forsberg, and A. Pittenger	

SECTION 2: KERGUELEN PLATEAU SEDIMENTOLOGY

10. Implications of sediment composition on the southern Kerguelen Plateau for paleoclimate and depositional environment	185
W. U. Ehrmann	
11. Analysis of sedimentary facies using bulk mineralogic characteristics in Cretaceous to Quaternary sediments from the Kerguelen Plateau: Sites 737, 738, and 744	211
G. Bohrmann and W. U. Ehrmann	
12. Cyclic sedimentation at Sites 745 and 746, Leg 119	225
W. U. Ehrmann and H. Grobe	
13. Late Miocene to Holocene glacial history of East Antarctica as revealed by sediments from Sites 745 and 746	239
W. U. Ehrmann, H. Grobe, and D. K. Fütterer	

SECTION 3: LOGGING

14. Lithologic interpretation from geophysical logs in Holes 737B, 738C, 739C, and 742A263
G. Ollier and B. Mathis

SECTION 4: IGNEOUS STUDIES

15. Mineralogy and geochemistry of a basalt from Site 738; implications for the tectonic history of the southernmost part of the Kerguelen Plateau293
C. Alibert
16. Composition, alteration, and origin of the basement lavas and volcaniclastic rocks at Site 738, southern Kerguelen Plateau299
K. W. Mehl, P. R. Bitschene, H.-U. Schminke, and J. Hertogen
17. Geochemical investigations of volcanic ash layers from Leg 119, Kerguelen Plateau323
W. Morche, H.-W. Hubberten, W. U. Ehrmann, and J. Keller

SECTION 5: GEOCHEMISTRY

18. Interstitial-water geochemistry of Kerguelen Plateau sediments347
S. R. Chambers and R. E. Cranston
19. Solute distributions and stable isotope chemistry of interstitial waters from Prydz Bay, Antarctica375
S. R. Chambers
20. Testing a higher resolution interstitial-water method for the Ocean Drilling Program393
R. E. Cranston
21. Sedimentation rate estimates from sulfate and ammonia gradients401
R. E. Cranston
22. Source and maturity of organic matter in glacial and Cretaceous sediments from Prydz Bay, Antarctica, Holes 739C and 741A407
T. J. McDonald, M. C. Kennicutt II, J. K. Rafalska, and R. G. Fox
23. Aliphatic hydrocarbons in sediments from Prydz Bay, Antarctica417
K. A. Kvenvolden, F. D. Hostetler, J. B. Rapp, and T. J. Frank

SECTION 6: PALEONTOLOGY

24. Paleogene and early Neogene planktonic foraminifer biostratigraphy of Sites 738 and 744, Kerguelen Plateau (southern Indian Ocean)427
B. T. Huber
25. Maestrichtian planktonic foraminifer biostratigraphy and the Cretaceous/Tertiary boundary at Hole 738C, Kerguelen Plateau (southern Indian Ocean)451
B. T. Huber
26. Upper Cretaceous and Cenozoic calcareous nannofossils of the Kerguelen Plateau (southern Indian Ocean) and Prydz Bay (East Antarctica)467
W. Wei and H. R. Thierstein
27. Danian calcareous nannofossil succession at Site 738 in the southern Indian Ocean495
W. Wei and J. J. Pospichal

28. Radiolarians from the Kerguelen Plateau, Leg 119513
J.-P. Caulet	
29. Diatom biostratigraphy: Kerguelen Plateau and Prydz Bay regions of the Southern Ocean547
J. G. Baldauf and J. A. Barron	
30. Distribution of <i>Chaetoceros</i> resting spores in the Quaternary sediments from Leg 119599
D. A. Stockwell	
31. Middle Eocene to Holocene benthic foraminifer assemblages from the Kerguelen Plateau (southern Indian Ocean)611
C. J. Schröder-Adams	
32. Late Cretaceous dinoflagellate cysts from the southern Kerguelen Plateau, Site 738631
B. A. Tocher	
33. Trace fossils and ichnofabric in Leg 119 cores635
M. L. Droser and D. J. Bottjer	

SECTION 7: BIOLOGY

34. Most abundant diatom species in water column assemblages from five Leg 119 sites in Prydz Bay, Antarctica: distributional patterns645
S.-H. Kang and G. A. Fryxell	
35. Comparisons of diatom biocoenoses with Holocene sediment assemblages in Prydz Bay, Antarctica667
D. A. Stockwell, S.-H. Kang, and G. A. Fryxell	
36. Comparison of winter and summer growth stages of the diatom <i>Eucampia antarctica</i> from the Kerguelen Plateau and south of the Antarctic convergence zone675
G. A. Fryxell	
37. Living bacteria in Antarctic sediments from Leg 119687
H. R. Thierstein and U. Störrlein	

SECTION 8: ISOTOPES, CHEMOSTRATIGRAPHY, AND PALEOMAGNETISM

38. Paleogene and early Neogene oceanography of the southern Indian Ocean: Leg 119 foraminifer stable isotope results693
E. Barrera and B. T. Huber	
39. Element stratigraphy across the Cretaceous/Tertiary boundary in Hole 738C719
B. Schmitz, F. Asaro, H. V. Michel, H. R. Thierstein, and B. T. Huber	
40. Strontium isotope stratigraphy of the Oligocene–lower Miocene section at Site 744, southern Indian Ocean731
E. Barrera, J. Barron, and A. Halliday	
41. Age determinations of Paleogene diamictites from Prydz Bay (Site 739), Antarctica, using Sr isotopes of mollusks and biostratigraphy of microfossils (diatoms and coccoliths)739
H. R. Thierstein, J. D. Macdougall, E. E. Martin, B. Larsen, J. Barron, and J. G. Baldauf	
42. Holocene chronology for the unconsolidated sediments at Hole 740A: Prydz Bay, East Antarctica747
E. Domack, A.J.T. Jull, and D. J. Donahue	

43. Paleomagnetism of Leg 119—Holes 737A, 738C, 742A, 745B, and 746A	751
H. Sakai and B. Keating	
44. Magnetostratigraphic studies of sediments from Site 744, southern Kerguelen Plateau	771
B. H. Keating and H. Sakai	
45. Amery Group red beds in Prydz Bay, Antarctica	795
B. H. Keating and H. Sakai	

SECTION 9: SYNTHESSES

46. Biochronologic and magnetostratigraphic synthesis of Leg 119 sediments from the Kerguelen Plateau and Prydz Bay, Antarctica	813
J. A. Barron, J. G. Baldauf, E. Barrera, J.-P. Caulet, B. T. Huber, B. H. Keating, D. Lazarus, H. Sakai, H. R. Thierstein, and W. Wei	
47. The Cretaceous/Tertiary boundary at Site 738, southern Kerguelen Plateau	849
H. R. Thierstein, F. Asaro, W. U. Ehrmann, B. Huber, H. Michel, H. Sakai, and B. Schmitz	
48. Evidence for late Eocene to early Oligocene Antarctic glaciation and observations on late Neogene glacial history of Antarctica: results from Leg 119	869
J. Barron, B. Larsen, and J. G. Baldauf	

SECTION 10: DATA REPORTS

49. <i>Data Report: High-resolution magnetic susceptibility and carbonate records: southern Kerguelen Plateau</i>	895
W. U. Dorn	
50. <i>Data Report: Higher resolution geochemical data, Leg 119</i>	903
R. E. Cranston	
51. <i>Data Report: Oligocene and Quaternary silicoflagellates from the Kerguelen Plateau</i>	933
D. Bukry	
52. <i>Data Report: Middle Miocene benthic foraminiferal oxygen and carbon isotopes and stratigraphy: southern ocean Site 744</i>	935
F. Woodruff and S. R. Chambers	
53. <i>Data Report: Palynology of sediments from Leg 119 drill sites in Prydz Bay, East Antarctica</i>	941
E. M. Truswell	

SECTION 11: POLICY

JOIDES advisory groups	949
Sample-Distribution Policy	955

SECTION 12: INDEX

Index	959

Back-pocket Foldouts

Chapter 1, Figure 2. Seismic reflection data for lines PB-21 and ODP-119 and interpretation of line ODP-119.

Chapter 26, Tables 3–6.

Table 3. Distribution of calcareous nannofossils, Hole 737B

Table 4. Distribution of calcareous nannofossils, Hole 738B

Table 5. Distribution of calcareous nannofossils, Hole 738C

Table 6. Distribution of calcareous nannofossils, Hole 744A

Back-pocket Microfiche

Chapter 6, Appendixes A–F. Grain-size distribution data, sediment and clay mineral composition, and clast roundness, Sites 739, 742, 743.

ACKNOWLEDGMENTS

Numerous individuals and institutions contributed to the success of Leg 119 of the Ocean Drilling Program and the assembly of this volume. Roland Schlich, Institut de Physique du Globe, Strasbourg, France, and Peter Barker, British Antarctic Survey, provided the initial proposals and planning for the Kerguelen and Prydz Bay parts of the cruise, respectively. Jim Kennett (University of California, Santa Barbara) and the Southern Oceans Regional Panel argued convincingly and successfully for including Prydz Bay in the drilling program.

Carl Brenner and the staff on the JOIDES/ODP Site Survey Data Bank of Lamont-Doherty Geological Observatory supplied us with seismic, bathymetric, magnetic, and core data. We are also grateful to Howard Stagg and Dave Falvey of the Australian Bureau of Mineral Resources for providing digital tapes of the Prydz Bay seismic data and to Jon Childs of the U.S. Geological Survey, Menlo Park, California, for processing that data. Yasuo Tamura of the Japan National Oil Company also graciously gave us multichannel seismic data from Prydz Bay.

Captain Gerard Kuster, his officers, and crew of the *JOIDES Resolution* (SEDCO BP/471) as well as Jack Tarbutton, drilling superintendent, and the drilling crew, were largely responsible for the success of the drilling operations along with Captain Peter Messmann and the crew of the *Maersk Master* (ice support vessel). The ODP shipboard scientific staff was dedicated, hard working, and enthusiastic. Everyone performed their job excellently, often under adverse conditions, and graciously contributed their friendship and good humor to making life onboard the *JOIDES Resolution* truly enjoyable.

The Ocean Drilling Program and its staff were very helpful in planning, staffing, and supplying the cruise; Lou Garrison, in particular, provided speedy and responsive liaison which helped ensure the success of the drilling program in Prydz Bay.

The manuscripts in this volume benefitted greatly from the unselfish reviews of the scientific colleagues listed earlier in this volume. We gratefully acknowledge them along with Janalisa Soltis, ODP Publications Coordinator, who demonstrated unselfish dedication and understanding during the editing process of this volume. This volume also owes much to the rest of the ODP Publications Staff for editorial work, art work, and assembly.

We gratefully acknowledge USSAC and the other national ODP programs for funding the scientists' participation in Leg 119 and their post-cruise research.
