

Turbidite sequences of Oligocene age imaged by the formation microscanner (FMS) in Hole 793B; numbers indicate depth in meters below the seafloor. The sequences are located in the frontal part of the Izu-Bonin volcanic arc, which marks the boundary between the Philippine and Pacific plates. Dark colors correspond to beds of electrically conductive clays; light colors correspond to coarse sand and conglomerate layers with relatively high resistance.

OCEAN DRILLING PROGRAM
TEXAS A&M UNIVERSITY

Eva M. Maddox
Volume Editor

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Canada/Australia Consortium for the Ocean Drilling Program, Department of Energy, Mines and Resources (Canada) and Department of Primary Industries and Energy (Australia)

Deutsche Forschungsgemeinschaft (Federal Republic of Germany)

European Science Foundation Consortium for Ocean Drilling (Belgium, Denmark, Finland, Iceland, Italy, Greece, The Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)

Institut Français de Recherche pour l'Exploitation de la Mer (France)

National Science Foundation (United States)

Natural Environment Research Council (United Kingdom)

University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

It is recommended that reference to the whole or to part of this volume be made in one of the following forms, as appropriate:

Taylor, B., Fujioka, K., et al., 1992. *Proc. ODP, Sci. Results*, 126: College Station, TX (Ocean Drilling Program).

Usui, A., 1992. Hydrothermal manganese minerals in Leg 126 cores. *In* Taylor, B., Fujioka, K., et al., *Proc. ODP, Sci. Results*, 126: College Station, TX (Ocean Drilling Program), 113–123.

Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is the correct one.

The mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 133 (*Initial Reports*): September 1991

Volume 134 (*Initial Reports*): March 1992

Volumes 136/137 (*Initial Reports*): January 1992

Volume 121 (*Scientific Results*): November 1991

Volume 122 (*Scientific Results*): February 1992

Volume 124 (*Scientific Results*): September 1991

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Foreword

By the National Science Foundation

The Ocean Drilling Program (ODP) is a major component of the National Science Foundation's continuing commitment to the study of the geologic processes that have shaped our planet and modified its environment. The scientific problems being addressed range from the geologic history and structure of continental margins to the processes responsible for the formation and alteration of the ocean's crust. In a time of enhanced public and scientific interest in problems of global change, ODP provides critical data on changes in ocean circulation, chemistry, and biologic productivity and their relation to changes in atmospheric circulation and glacial conditions. The Ocean Drilling Program has a unique role in addressing these problems, since it is the only facility for continuously sampling the geologic record of the ocean basins, which cover 70% of our planet.

The ODP is the successor to the Deep Sea Drilling Project (DSDP), which was a global reconnaissance of the ocean basins. DSDP began operations in 1968 at Scripps Institution of Oceanography, using a 400-foot drillship, the *Glomar Challenger*. DSDP was supported initially by only the National Science Foundation, with extensive involvement of international scientists who were invited to participate on drilling cruises. As this international interest continued to grow in the early 1970's, formal participation in the project was offered to the international geoscience community. In 1975, five nations (France, the Federal Republic of Germany, Japan, the United Kingdom, and the Soviet Union) accepted this commitment to joint planning and conduct of the project, as well as to financial support for operations. This International Phase of Ocean Drilling (IPOD) continued to 1983. Although the *Challenger* had reached the limits of her capabilities, the remarkable scientific success of the DSDP and the new questions it had generated demanded a continuing capability for drilling in the oceans.

The Ocean Drilling Program was organized, international participation was coordinated, a new drillship (the *JOIDES Resolution*) was contracted and outfitted, and her first cruise sailed in early 1985, within 18 months of the retirement of the *Challenger*. This is a remarkable accomplishment that reflects the efforts and excellence of the Joint Oceanographic Institutions, Inc. (prime contractor for ODP), Texas A&M University (science and ship operator), Lamont-Doherty Geological Observatory (logging operator), and the international science community in organizing and planning the new program. It was argued in planning for the ODP that a larger drillship was required to provide space for the increasing U.S. and international demand for shipboard participation, improved and expanded laboratory capabilities, and improvements in coring and logging systems. A larger and better equipped vessel would also provide better stability and working conditions in high-latitude regions of the oceans. The success of the *JOIDES Resolution* has proven the wisdom of these early arguments.

ODP now has operated in all oceans except the ice-covered Arctic. We have drilled above the Arctic circle and within sight of the Antarctic continent. Over 1000 scientists from 25 nations have participated in the initial ODP cruises. The larger scientific parties have allowed an increased emphasis on student participation and training aboard ship. The state-of-the-art laboratories support rapid and complete initial analyses of samples that provide both scientific results and guide subsequent shore-based studies. Nearly 1000 additional scientists have used these data and requested samples from the program's core and data archives for continuing study. The geochemical and geophysical logging capability is unsurpassed in either academia or industry and has provided remarkable new data with which to study the Earth. New experiments to measure and monitor geologic processes have been deployed in ODP boreholes.

The international commitment to ocean drilling has increased in the ODP. In addition to our five partners in IPOD—France, the Federal Republic of Germany, Japan, the Soviet Union, and the United Kingdom—two consortia have joined ODP: Canada-Australia and the European Science Foundation (representing Belgium, Denmark, Finland, Greece, Iceland, Italy, The Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey). The 20 countries of the ODP represent the community of nations that have a global interest in the geosciences and oceanography. This global scientific participation has assured the program's scientific

excellence by focusing and integrating the combined scientific knowledge and capabilities of the program's 20 nations. It has allowed problems of a global nature to be addressed by providing databases and background studies which are openly shared for planning and interpreting drilling results. It has eased problems of access to territorial waters, allowing comparative studies to be done among oceans. Finally, the international sharing of program costs has allowed this important and large program to proceed without detrimental impact to the research budgets of any one nation.

The Ocean Drilling Program, like its predecessor, DSDP, serves as a model for planning, conducting, and financing research to address problems of global importance. The National Science Foundation is proud to have a leading role in this unique international program, and we look forward to its continuing success.

Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents scientific and engineering results from the Ocean Drilling Program (ODP). The papers presented here address the scientific and technical goals of the program, which include providing a global description of geological and geophysical structures including passive and active margins and sediment history, and studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations.

The Ocean Drilling Program, an international activity, operates a specially equipped deep-sea drilling ship, the *JOIDES Resolution* (Sedco/BP 471), which contains state-of-the-art laboratories, equipment, and computers. The ship is 471 feet (144 meters) long, is 70 feet (21 meters) wide, and has a displacement of 18,600 short tons. Her derrick towers 211 feet (64 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 51 and a ship's crew (including the drill crew) of 62. The size and ice-strengthening of the ship allow drilling in high seas and ice-infested areas as well as permitting a large group of multidisciplinary scientists to interact as part of the scientific party.

Logging, or measurements in the drilled holes, is an important part of the program. ODP provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiewer is available for imaging the wall of the hole, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the wall of the hole, and a vertical seismic profiler can record reflectors from below the total depth of the hole.

The management of the Ocean Drilling Program involves a partnership of scientists and governments. International oversight and coordination are provided by the ODP Council, a governmental consultative body of the partner countries, which is chaired by a representative from the United States National Science Foundation. The ODP Council periodically reviews the general progress of the program and discusses financial plans and other management issues. Overall scientific and management guidance is provided to the operators of the program by representatives from the group of institutions involved in the program, called the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES).

The Executive Committee (EXCOM), made up of the administrative heads of the JOIDES institutions, provides general oversight for ODP. The Planning Committee (PCOM), with its advisory structure, is made up of working scientists and provides scientific advice and detailed planning. PCOM has a network of panels and working groups that screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical-survey data and other safety and siting information. PCOM uses the recommendations of the panels and committees to select drilling targets, to specify the location and major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists.

Joint Oceanographic Institutions, Inc. (JOI), a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor for ODP. JOI is responsible for seeing that the scientific objectives, plans, and recommendations of the JOIDES committees are translated into scientific operations consistent with scientific advice and budgetary constraints. JOI subcontracts the operations of the program to two universities: Texas A&M University and Lamont-Doherty Geological Observatory of Columbia University. JOI is also responsible for managing the U.S. contribution to ODP.

Texas A&M University (TAMU) serves as science operator for ODP. In this capacity, TAMU is responsible for planning the specific ship operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the relevant

panels. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and computers and by providing logistical and technical support for shipboard scientific teams. Onshore, TAMU manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of scientific results.

Lamont-Doherty Geological Observatory (LDGO) of Columbia University is responsible for the program's logging operation, including processing the data and providing assistance to scientists for data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDGO.

Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at three sites: ODP Pacific and Indian Ocean cores at TAMU, ODP and DSDP Atlantic and Antarctic cores at LDGO, and DSDP Pacific and Indian Ocean cores at the Scripps Institution of Oceanography.

Scientific achievements of ODP include new information on early seafloor spreading and how continents separate and the margins evolve. The oldest Pacific crust has been drilled and sampled. We have new insights into glacial cycles and the fluctuations of ocean currents throughout geological time. Many of the scientific goals can be met only with new technology; thus the program has focused on engineering as well as science. To date, ODP engineers have demonstrated the capability to drill on bare rock at mid-ocean-ridge sites and have developed techniques for drilling in high-temperature and corrosive regions typical of hydrothermal vent areas. A new diamond coring system promises better core recovery in difficult areas.

In addition, ODP is cooperating closely with other geological and geophysical programs; for example, in 1991 the first hole was drilled by ODP for emplacement of a seismometer near Hawaii for the Ocean Seismic Network. JOI is pleased to have been able to play a facilitating role in the Ocean Drilling Program and its cooperative activities, and we are looking forward to many new results to come.

D. James Baker

Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

Scientific Results volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly.

In acknowledgment of the contributions made by this volume's Editorial Review Board, names of the individual Board members are listed on the title page. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

TABLE OF CONTENTS

VOLUME 126—SCIENTIFIC RESULTS

SECTION 1: LITHOSTRATIGRAPHY

1. Episodic deposition of Pliocene-Pleistocene pumice from the Izu-Bonin Arc, Leg 126	3
A. Nishimura, K. S. Rodolfo, A. Koizumi, J. Gill, and K. Fujioka	
2. Correlation of Quaternary tephra throughout the Izu-Bonin areas	23
K. Fujioka, A. Nishimura, Y. Matsuo, and K. S. Rodolfo	
3. Tephra of the Izu-Bonin forearc (Sites 787, 792, and 793)	47
K. Fujioka, Y. Matsuo, A. Nishimura, M. Koyama, and K. S. Rodolfo	
4. Sedimentology of deep-water volcanoclastics, Oligocene Izu-Bonin forearc basin, based on formation microscanner images	75
R. N. Hiscott, A. Colella, P. Pezard, M. A. Lovell, and A. Malinverno	
5. Textural characteristics of Oligocene submarine debris-flow deposits, Sites 792 and 793	97
K. S. Rodolfo, A. T. Arguden, and R. U. Solidum	
6. Diagenetic and hydrothermal mineral alteration observed in Izu-Bonin deep-sea sediments, Leg 126	101
K. Tazaki and W. S. Fyfe	
7. Hydrothermal manganese minerals in Leg 126 cores	113
A. Usui	
8. Diagenetic trends in Leg 126 sandstones	125
K. M. Marsaglia and K. Tazaki	
9. Petrography and provenance of volcanoclastic sands recovered from the Izu-Bonin Arc, Leg 126	139
K. M. Marsaglia	
10. Composition of heavy minerals from sands and sandstones of the Izu-Bonin Arc, Leg 126	155
K. Fujioka and S. Saito	
11. Glass inclusions with microglobules in plagioclase and pyroxene phenocrysts of volcanic rocks from the Bonin Arc, Leg 126	171
T. Watanabe, T. Hirama, M. Yuasa, S. Terada, and K. Fujioka	
12. Prehnite-pumpellyite facies metamorphism in oceanic arc basement from Site 791 in the Sumisu Rift, western Pacific	185
M. Yuasa, T. Watanabe, T. Kuwajima, T. Hirama, and K. Fujioka	
13. Vein structures and their tectonic implications for the development of the Izu-Bonin forearc, Leg 126	195
Y. Ogawa, J. Ashi, and K. Fujioka	
14. Deep-water trace fossils and their environmental significance in forearc and backarc Cenozoic successions around the Izu-Bonin Arc, Leg 126	209
A. Colella, A. D'Alessandro, and R. De Rosa	
15. Carbonate bioclasts of shallow-water origin at Site 793	231
A. Nishimura	

SECTION 2: BIOSTRATIGRAPHY

16. Pleistocene and Oligocene-Miocene calcareous nannofossils from the Sumisu Rift and Izu-Bonin forearc basin	237
J. V. Firth and M. Isiminger-Kelso	
17. Morphometric changes of the genus <i>Gephyrocapsa</i> at Site 790, subtropical Pacific Ocean	263
H. Matsuoka and K. Fujioka	
18. Eocene through Quaternary planktonic foraminifers from the northwest Pacific, Leg 126	271
Y. Herman	
19. Eocene to Quaternary benthic foraminifers and paleobathymetry of the Izu-Bonin Arc, Legs 125 and 126	285
K. Kaiho	
20. Distribution of Holocene benthic foraminifers in the Izu-Bonin Arc	311
K. Kaiho and A. Nishimura	
21. Radiolarians from sediments of the Izu-Bonin region, Leg 126	321
J. C. Aitchison	

SECTION 3: PALEOMAGNETICS

22. NRM/IRM measurements on sedimentary and igneous rocks from Leg 126, the Izu-Bonin Arc	333
S. M. Cisowski	
23. Detailed record of the Brunhes/Matuyama polarity reversal in high sedimentation rate marine sediments from the Izu-Bonin Arc	341
S. M. Cisowski and M. Koyama	
24. Paleomagnetic evidence for northward drift and clockwise rotation of the Izu-Bonin forearc since the early Oligocene	353
M. Koyama, S. M. Cisowski, and P. Pezard	
25. Paleomagnetic estimate of emplacement mechanisms of deep basaltic volcanoclastic rocks in the Sumisu Rift, Izu-Bonin Arc	371
M. Koyama, S. M. Cisowski, and J. B. Gill	

SECTION 4: IGNEOUS PETROLOGY AND GEOCHEMISTRY

26. Petrology and geochemistry of Pliocene-Pleistocene volcanic rocks from the Izu Arc, Leg 126	383
J. B. Gill, C. Seales, P. Thompson, A. G. Hochstaedter, and C. Dunlap	
27. Igneous geochemistry and petrogenesis of the Izu-Bonin forearc basin	405
R. N. Taylor, H. Lapierre, P. Vidal, R. W. Nesbitt, and I. W. Croudace	
28. Mineral chemistry of forearc volcanic rocks from the Izu-Bonin Arc, Holes 792E and 793B	431
H. Lapierre, R. N. Taylor, O. Rouer, and H. Chaisemartin	
29. Sulfur isotope ratios of Leg 126 igneous rocks	449
P. Torssander	

SECTION 5: SEDIMENT/FLUID GEOCHEMISTRY

30. Characterization and correlation of megascopic tephras in Site 792 cores from the Izu-Ogasawara forearc basin (Japan) by trace elements and $^{87}\text{Sr}/^{86}\text{Sr}$ and $^{143}\text{Nd}/^{144}\text{Nd}$ isotopes	457
P. K. Egeberg, A. O. Brunfelt, and A. S. Stabel	

31. Major and trace element geochemistry of Oligocene to Quaternary volcaniclastic sands and sandstones from the Izu-Bonin Arc	467
R. N. Hiscott and J. B. Gill	
32. Pelagic and hemipelagic sediments of the Izu-Bonin region, Leg 126: geochemical and compositional features	487
A. Nishimura, N. Mita, and M. Nohara	
33. Major-oxide stratigraphy of glass shards in volcanic ash layers of the Izu-Bonin arc-backarc sites (Sites 788/789 and 790/791)	505
K. S. Rodolfo, R. U. Solidum, A. Nishimura, Y. Matsuo, and K. Fujioka	
34. Thermodynamic aspects of Leg 126 interstitial waters	519
P. K. Egeberg	
35. Amino acids in interstitial waters from Sites 790 and 791 in the Izu-Bonin island arc	531
H. Kawahata and T. Ishizuka	

SECTION 6: PHYSICAL PROPERTIES, SEISMIC STRATIGRAPHY, AND DOWNHOLE MEASUREMENTS

36. Physical properties of volcaniclastic sediments in the Izu-Bonin area	543
K. A. Dadey and A. Klaus	
37. Dry-bulk density: its use and determination	551
K. A. Dadey, T. Janecek, and A. Klaus	
38. Structural and stratigraphic evolution of the Sumisu Rift, Izu-Bonin Arc	555
A. Klaus, B. Taylor, G. F. Moore, M. E. MacKay, G. R. Brown, Y. Okamura, and F. Murakami	
39. Correlation of core and seismic stratigraphy by means of vertical seismic profiling, and downhole and physical properties measurements for the Leg 126 forearc sites (787, 792, and 793)	575
P. A. Cooper, K. A. Dadey, A. Klaus, M. A. Lovell, P. A. Pezard, and B. Taylor	
40. Chemical stratigraphy of boreholes in the Izu-Bonin Arc from <i>in situ</i> nuclear measurements	593
M. A. Lovell, P. A. Pezard, and P. K. Harvey	
41. Downhole electrical images in volcaniclastic sequences of the Izu-Bonin forearc basin, western Pacific	603
P. A. Pezard, M. A. Lovell, and R. N. Hiscott	

SECTION 7: SYNTHESSES

42. Rifting and the volcanic-tectonic evolution of the Izu-Bonin-Mariana Arc	627
B. Taylor	
43. Geochemical well logs in the Izu-Bonin arc-trench system, Sites 791, 792, and 793	653
E. L. Pratson, R. Reynolds, M. A. Lovell, P. A. Pezard, and C. Broglia	
44. K-Ar dating results from whole-rock and mineral separates of the Izu-Bonin forearc basement, Leg 126	677
R. N. Taylor and J. G. Mitchell	

SECTION 8: POLICY

JOIDES Advisory Groups	683
Sample-Distribution Policy	687

SECTION 9: INDEX

Index 691

Back-pocket Foldout

Chapter 4. Figure 4. FMS-based sedimentary log, Hole 792E.

Chapter 4. Figure 5. FMS-based sedimentary log, Hole 793B.

Back-pocket Microfiche

Chapter 2: Appendix. Chemical compositions of volcanic glasses at arc Site 788 and at backarc Sites 790/791.

Chapter 3: Appendix A. Results of the grain-size analyses of the tephra layers from forearc Sites 792 and 793.

Chapter 3: Appendix B. Chemical compositions of the tephra layers from forearc Sites 792 and 793.

Chapter 33: Appendix. Summary of analyses, Sites 788, 790, and 791.
