

35. DATA REPORT: SUMMARY OF GEOCHEMICAL DATA FOR LEG 129 IGNEOUS ROCKS¹

Paterno R. Castillo,² Peter A. Floyd,³ Christian France-Lanord,⁴ and Jeffrey C. Alt⁵

This report presents all the available major and trace elemental analyses and Sr, Nd, and Pb isotopic compositions of basaltic rocks recovered from Ocean Drilling Program Sites 800, 801, and 802 during Leg 129 (Table 1). Its main purpose is to provide other investigators a complete summary of geochemical data for Leg 129 basement basalts that they can use for later work. Detailed discussions of the data are presented elsewhere in the volume by Floyd and Castillo (Site 801 geochemistry and petrogenesis), Floyd et al. (Sites 800 and 802 geochemistry and petrography), Alt et al. (Site 801 alteration), and Castillo et al. (Sr, Nd, and Pb isotope geochemistry of Leg 129 basalts).

A vast majority of the major oxide and trace elemental analyses were done by standard X-ray fluorescence (XRF) method at the Geoscience Analytical Services, University of Keele (M. Aikin and D. Emley, analysts). A few (22) of the determinations were done at the Department of Geological Sciences, The University of Michigan (labeled UM in Table 1; J. Alt, analyst). Loss on ignition (LOI) were also determined at these two laboratories. Major oxides were analyzed in fused glass beads and trace elements Ba, Co, Cr, Cu, Ga, Nb, Ni, Pb, Rb, S, Sr, V, Y, Zn, and Zr in pressed powder pellets. FeO was determined by titration with potassium dichromate. Based on repeated analyses of rock standards, the analytical precision (measured by the coefficient of variation) for major oxides is generally better than 1.5% and for trace elements is better than 5%.

Contents of H₂O⁺ and CO₂ of aliquots of powders analyzed for major and trace elements were determined at the Centre de Recherches Petrographiques et Geochimiques (M. Vernet, analyst). Water was determined by volumetry. Samples were preheated at 105°C, weighed and

then heated again at 1400°C in a tubular furnace. Released water was measured by titration using the dynamic Karl Fisher method. Standard deviation is 0.017 at 0.5 wt% and 0.045 at 3 wt%. Carbon dioxide from carbonate analyses were done using a Beckman DU-62 coulometer. Standard deviation is 0.01 at 0.1 wt% and 0.02 at 1 wt%.

Other trace elements such as Co, Cs, Hf, Sc, Ta, Th, U, and the rare earths (La to Lu) were determined in the same powders of a subset of the samples analyzed by XRF at the University of Keele by instrumental neutron activation analysis (INAA) at the Department of Earth and Planetary Sciences, Washington University (labeled WU in Table 1; R. Korotev, analyst) and Universities Research Reactor, Risley (G. Gilmore, analyst). The rare earth element contents of a few samples were analyzed by inductively coupled plasma (ICP) emission spectrometry at Royal Holloway and Bedford New College, University of London (N. Walsh, analyst) and ICP results are basically identical to the Universities Research Reactor INAA results (Floyd and Castillo, this volume); these two types of trace element analyses were all reported as INAA data in Table 1. In general, data for four samples collected at the two INAA facilities also show reasonable agreement (Table 2).

Isotopic composition measurements were done on leached powders of samples from Sites 800 and 801 to correct for seawater alteration; those for Site 802 samples were done on hand-picked basaltic glasses. All Pb isotopic and most Sr and Nd isotopic analyses were done by thermal ionization mass spectrometry at the Department of Terrestrial Magnetism, Carnegie Institution of Washington (P. Castillo, analyst). A few Sr and Nd isotopic measurements were done at the Geological Survey Division, Scripps Institution of Oceanography. Analytical precision for ²⁰⁶Pb/²⁰⁴Pb is ±0.015, ²⁰⁷Pb/²⁰⁴Pb is ±0.019, ²⁰⁸Pb/²⁰⁴Pb is ±0.060, ⁸⁷Sr/⁸⁶Sr is ±0.000020, and ¹⁴³Nd/¹⁴⁴Nd is ±0.000023 (±0.000017 at Scripps).
