Shore-based Staff Scientist

Prepared by the
OCEAN DRILLING PROGRAM
TEXAS A&M UNIVERSITY

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Canada/Australia Consortium for the Ocean Drilling Program, Department of Energy, Mines and Resources (Canada), and Department of Primary Industries and Energy (Australia)

Deutsche Forschungsgemeinschaft (Federal Republic of Germany)

European Science Foundation Consortium for Ocean Drilling (Belgium, Denmark, Finland, Greece, Iceland, Italy, The Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)

Institut Français de Recherche pour l'Exploitation de la Mer (France)

National Science Foundation (United States)

Natural Environment Research Council (United Kingdom)

University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

Reference to the whole or to part of this volume should be made as follows:

Rea, D.K., Basov, I.A., Scholl, D.W., and Allan, J.F. (Eds.), 1995. *Proc. ODP, Sci. Results*, 145: College Station, TX (Ocean Drilling Program).

Barron, J.A., and Gladenkov, A.Y., 1995. Early Miocene to Pleistocene diatom stratigraphy of Leg 145. In Rea, D.K., Basov, I.A., Scholl, D.W., and Allan, J.F. (Eds.). *Proc. ODP, Sci. Results*, 145: College Station, TX (Ocean Drilling Program), 3–19.

Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is the correct one.

Mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 155 (*Initial Reports*): July 1995

Volume 156 (*Initial Reports*): September 1995

Volume 157 (*Initial Reports*): November 1995

Volume 141 (*Scientific Results*): September 1995

Volumes 142/143 (*Scientific Results*): May 1995

Volume 146 Part 2 (*Scientific Results*): October 1995

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547, U.S.A. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Printed November 1995

Foreword

By the National Science Foundation

The National Science Foundation is proud to play a leading role in partnership with the U.S. oceanographic community in the operation and management of the Ocean Drilling Program (ODP). We are equally proud of the cooperation and commitment of our international partners, who contribute both financial and intellectual resources required to maintain the high quality of this unique program. The Ocean Drilling Program, like its predecessor, the Deep Sea Drilling Project (DSDP), is a model for the organization and planning of research to address global scientific problems that are of high priority internationally and of long-term interest to the scientific community and general public.

Major scientific themes guiding the development of specific drilling cruises range from determining the causes and effects of oceanic and climatic variability to understanding the circulation of fluids in the ocean crust and the resultant formation of mineral deposits. Although such studies are at the forefront of basic scientific inquiry into the processes that control and modify the global environment, they are equally important in providing the background for assessing man's impact on the global environment or for projecting resource availability for future generations.

The transition from the DSDP to the ODP was marked by a number of changes. The 471-foot *JOIDES Resolution*, which replaced the *Glomar Challenger*, has allowed larger scientific parties and the participation of more graduate students, a larger laboratory and technical capability, and operations in more hostile ocean regions. The *JOIDES Resolution* has drilled in all of the world's oceans, from the marginal ice regions of the Arctic to within sight of the Antarctic continent. Over 1,200 scientists and students from 26 nations have participated on project cruises. Cores recovered from the cruises and stored in ODP repositories in the United States and Europe have provided samples to an additional 1,000 scientists for longer term post-cruise research investigations. The downhole geochemical and geophysical logging program, unsurpassed in either academia or industry, is providing remarkable new data with which to study the Earth.

In 1994, NSF and our international partners renewed our commitment to the program for its final phase. Of the 20 countries that supported ODP initially, only one, Russia, has been unable to continue for financial reasons. As the reputation and scientific impact of the program continue to grow internationally, we hope to add additional members and new scientific constituencies. This global scientific participation continues to assure the program's scientific excellence by focusing and integrating the combined scientific knowledge and capabilities of its member nations.

We wish the program smooth sailing and good drilling!

Neal Lane
Director
National Science Foundation

Arlington, Virginia

Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents scientific and engineering results from the Ocean Drilling Program (ODP). The papers presented here address the scientific and technical goals of the program, which include providing a global description of geological and geophysical structures including passive and active margins and sediment history, and studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations.

The Ocean Drilling Program, an international activity, operates a specially equipped deep-sea drilling ship, the *JOIDES Resolution* (Sedco/BP 471), which contains state-of-the-art laboratories, equipment, and computers. The ship is 471 feet (144 meters) long, is 70 feet (21 meters) wide, and has a displacement of 18,600 short tons. Her derrick towers 211 feet (64 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 51 and a ship's crew (including the drill crew) of 62. The size and ice-strengthening of the ship allow drilling in high seas and ice-infested areas as well as permit a large group of multidisciplinary scientists to interact as part of the scientific party.

Logging, or measurements in the drilled holes, is an important part of the program. ODP provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiewer is available for imaging the wall of the hole, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the wall of the hole, and a vertical seismic profiler can record reflectors from below the total depth of the hole.

The management of the Ocean Drilling Program involves a partnership of scientists and governments. International oversight and coordination are provided by the ODP Council, a governmental consultative body of the partner countries, which is chaired by a representative from the United States National Science Foundation. The ODP Council periodically reviews the general progress of the program and discusses financial plans and other management issues. Overall scientific and management guidance is provided to the operators of the program by representatives from the group of institutions involved in the program, called the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES).

The Executive Committee (EXCOM), made up of the administrative heads of the JOIDES institutions, provides general oversight for ODP. The Planning Committee (PCOM), with its advisory structure, is made up of working scientists and provides scientific advice and detailed planning. PCOM has a network of panels and working groups that screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical-survey data and other safety and siting information. PCOM uses the recommendations of the panels and committees to select drilling targets, to specify the location and major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists.

Joint Oceanographic Institutions, Inc. (JOI), a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor for ODP. JOI is responsible for seeing that the scientific objectives, plans, and recommendations of the JOIDES committees are translated into scientific operations consistent with scientific advice and budgetary constraints. JOI subcontracts the operations of the program to two universities: Texas A&M University and Lamont-Doherty Earth Observatory of Columbia University. JOI is also responsible for managing the U.S. contribution to ODP.

Texas A&M University (TAMU) serves as science operator for ODP. In this capacity, TAMU is responsible for planning the specific ship operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the relevant panels. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and computers and by providing logistical and technical support for shipboard scientific teams. Onshore, TAMU manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of scientific results.

Lamont-Doherty Earth Observatory (LDEO) of Columbia University is responsible for the program's logging operation, including processing the data and providing assistance to scientists for data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDEO.

Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at four sites: ODP Pacific and Indian Ocean cores at TAMU, DSDP Pacific and Indian Ocean cores at the Scripps Institution of Oceanography, ODP and DSDP Atlantic and Antarctic cores through Leg 150 at LDEO, and ODP Atlantic and Antarctic cores since Leg 151 at the University of Bremen, Federal Republic of Germany.

Scientific achievements of ODP include new information on early seafloor spreading and how continents separate and the margins evolve. The oldest Pacific crust has been drilled and sampled. We have new insights into glacial cycles and the fluctuations of ocean currents throughout geological time. Many of the scientific goals can be met only with new technology; thus the program has focused on engineering as well as science. To date, ODP engineers have demonstrated the capability to drill on bare rock at mid-ocean-ridge sites and have developed techniques for drilling in high-temperature and corrosive regions typical of hydrothermal vent areas. A new diamond coring system promises better core recovery in difficult areas.

In addition, ODP is cooperating closely with other geological and geophysical programs; for example, in 1991 the first hole was drilled by ODP for emplacement of a seismometer near Hawaii for the Ocean Seismic Network. JOI is pleased to have been able to play a facilitating role in the Ocean Drilling Program and its cooperative activities, and we are looking forward to many new results to come.

President
Joint Oceanographic Institutions, Inc.

Washington, D.C.

Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

Scientific Results volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly.

In acknowledgment of the contributions made by this volume's Editorial Review Board, the members of the Board are designated Editors of the volume and are listed on the title page as well. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

TABLE OF CONTENTS

VOLUME 145—SCIENTIFIC RESULTS

SECTION 1: PALEONTOLOGY

1. Early Miocene to Pleistocene diatom stratigraphy of Leg 1453
J.A. Barron and A.Y. Gladenkov
2. Oligocene and early middle Miocene diatom biostratigraphy of Hole 884B.....21
A.Y. Gladenkov and J.A. Barron
3. High-resolution diatom paleoclimatology of the middle part of the Pliocene of the Northwest Pacific43
J.A. Barron
4. Miocene to Pleistocene radiolarian biostratigraphy of North Pacific Sites 881, 884, 885, 886, and 88755
J.J. Morley and C. Nigrini
5. Miocene–Pliocene radiolarians from Leg 145, North Pacific93
V.V. Shilov
6. Eocene–Oligocene radiolarians from Leg 145, North Pacific117
V.V. Shilov
7. A high-resolution stratigraphy for Pleistocene sediments from North Pacific Sites 881, 883, and 887 based on abundance variations of the radiolarian *Cycladophora davisian*.....133
J.J. Morley, V.L. Tiase, M.M. Ashby, and M. Kashgarian
8. Middle Pliocene planktonic and benthic foraminifers from the subarctic North Pacific: Sites 883 and 887141
H.J. Dowsett and S.E. Ishman
9. Paleogene planktonic foraminifer biostratigraphy of Sites 883 and 884, Detroit Seamount (Subarctic Pacific)157
I.A. Basov
10. Preliminary results from pollen analyses of selected samples from Leg 145.....171
L.E. Heusser and J.J. Morley

SECTION 2: SEDIMENTOLOGY

11. Late Cenozoic ice-rafting records from Leg 145 sites in the North Pacific: late Miocene onset, late Pliocene intensification, and Pliocene–Pleistocene events179
L.A. Krissek
12. Provenance of Pliocene–Pleistocene ice-rafted debris, Leg 145, Northern Pacific Ocean195
B.C. McKelvey, W. Chen, and R.J. Arculus
13. Composite depth scale and stratigraphy for Sites 885/886205
G.R. Dickens, H. Snoeckx, E. Arnold, J.J. Morley, R.M. Owen, D.K. Rea, and L. Ingram
14. Eolian and silica deposition in the central North Pacific: results from Sites 885/886219
H. Snoeckx, D.K. Rea, C.E. Jones, and B.L. Ingram

15. Paleoenvironmental variation based on the mineralogy and rock-magnetic properties of sediment from Sites 885 and 886	231
E. Arnold, M. Leinen, and J. King	
16. Sediment fluxes in the Gulf of Alaska: paleoceanographic record from Site 887 on the Patton-Murray Seamount platform	247
D.K. Rea and H. Snoeckx	
17. Stable isotope stratigraphy and chronology of the upper Quaternary section at Site 883, Detroit Seamount	257
L.D. Keigwin	
18. Isotopic and faunal record of Paleogene deep-water transitions in the North Pacific	265
D.K. Pak and K.G. Miller	
19. Astronomical calibration of cycle stratigraphy for Site 882 in the northwest Pacific	283
R. Tiedemann and G.H. Haug	
20. Evolution of northwest Pacific sedimentation patterns since 6 Ma (Site 882).....	293
G.H. Haug, M.A. Maslin, M. Sarnthein, R. Stax, and R. Tiedemann	
21. Northwest Pacific Site 882: the initiation of Northern Hemisphere glaciation	315
M.A. Maslin, G.H. Haug, M. Sarnthein, R. Tiedemann, H. Erlenkeuser, and R. Stax	

SECTION 3: GEOCHEMISTRY AND PETROLOGY

22. Geochemistry and ⁴⁰ Ar/ ³⁹ Ar geochronology of basalts from ODP Leg 145 (North Pacific Transect).....	333
R.A. Keller, R.A. Duncan, and M.R. Fisk	
23. Geochemistry and petrology of volcanic ashes recovered from Sites 881 through 884: a temporal record of Kamchatka and Kurile volcanism.....	345
L.-Q. Cao, R.J. Arculus, and B.C. McKelvey	
24. Pb isotope ratios of North Pacific sediments, Sites 881, 883, and 884: implications for sediment recycling in the Kamchatkan arc	383
A.B. Kersting	
25. Copper mineralization at Site 884 in the North Pacific	389
G.R. Dickens, R.M. Owen, and T.F. Pedersen	
26. Ichthyolith strontium isotopic stratigraphy of deep-sea clays: Sites 885 and 886 (North Pacific Transect).....	399
B.L. Ingram	
27. Chinook Trough rifting and hydrothermal deposition at Sites 885 and 886.....	413
G.R. Dickens and R.M. Owen	
28. Identification and characterization of the Cretaceous/Tertiary boundary at ODP Sites 886 and 803 and DSDP Site 576.....	427
F.T. Kyte, J.A. Bostwick, and L. Zhou	

SECTION 4: UNDERWAY GEOPHYSICS, BOREHOLE GEOPHYSICS, AND PALEOMAGNETISM

29. Seismic stratigraphy of Cenozoic sediments from North Pacific seamount platform and deep-sea sites, Leg 145.....	437
T.S. Hamilton	

30. Downhole magnetic logging in sediments during Leg 145: usefulness and magnetostratigraphic interpretation of the logs at Site 884	455
G. Dubuisson, J. Thibaut, V. Barthès, J. Pocachard, and J.-P. Pozzi	
31. Detailed variation of geomagnetic field intensity during the late Pleistocene at Site 882	469
M. Okada	
32. Geomagnetic intensity and field direction changes associated with the Matuyama/Brunhes polarity reversal, as recorded in a sediment core from the North Pacific	475
S.M. Cisowski	
33. Mineral magnetic properties of middle and upper Pleistocene sediments at Sites 883, 884, and 887, North Pacific Ocean	483
A.P. Roberts, K.L. Verosub, R.J. Weeks, B. Lehman, and C. Laj	
34. Magnetostratigraphy of upper Cenozoic sediments from Leg 145, North Pacific Ocean	491
R.J. Weeks, A.P. Roberts, K.L. Verosub, M. Okada, and G.J. Dubuisson	

SECTION 5: GEOTECHNICAL PROPERTIES

35. Geotechnical properties and consolidation characteristics of North Pacific sediments, Sites 881, 883, and 885/886	525
A.K. Rutledge, J.A. Roberts, T.H. Orsi, W.R. Bryant, and A.T. Kotilainen	
36. Submarine slope stability analysis on the Detroit Seamount, Site 883	547
J.A. Roberts, A.K. Rutledge, and A.T. Kotilainen	

SECTION 6: SYNTHESSES

37. Biostratigraphic and magnetostratigraphic summary	559
J.A. Barron, I.A. Basov, L. Beaufort, G. Dubuisson, A.Y. Gladenkov, J.J. Morley, M. Okada, G. Ólafsson, D.K. Pak, A.P. Roberts, V.V. Shilov, and R.J. Weeks	
38. Scientific results of drilling the North Pacific Transect	577
D.K. Rea, I.A. Basov, L.A. Kriisek, and the Leg 145 Scientific Party	

SECTION 7: DATA REPORTS

39. <i>Data Report: Oligocene–Pleistocene calcareous nannofossils from Leg 145</i>	599
G. Ólafsson and L. Beaufort	
40. <i>Data Report: Upper Cretaceous and Paleogene calcareous nannofossils from the North Pacific</i>	633
L. Beaufort and G. Ólafsson	
41. <i>Data Report: Oligocene and Miocene silicoflagellates from the northern Emperor Seamount Chain, Site 883</i>	639
D. Bukry	
42. <i>Data Report: Organic carbon and carbonate records from Detroit Seamount and Patton-Murray Seamount: results from Sites 882 and 887 (North Pacific Transect)</i>	645
R. Stax and R. Stein	
43. <i>Data Report: Mineralogy of Site 884</i>	657
E. Arnold	
44. <i>Data Report: Geochemistry of volcanic ashes recovered from Hole 887A</i>	661
L.-Q. Cao, R.J. Arculus, and B.C. McKelvey	

45. <i>Data Report: Interstitial water chemistry, Leg 145</i>	671
T.F. Pedersen and B.L. Ingram	
46. <i>Data Report: Onshore geochemical processing, Leg 145</i>	677
J.F. Bristow, C. Broglia, P.B. deMenocal, and P.K. Harvey	

SECTION 8: INDEX

Index	691
