Prepared by the  
OCEAN DRILLING PROGRAM  
TEXAS A&M UNIVERSITY

Ruth N. Riegel  
*Volume Editor*

in cooperation with the  
NATIONAL SCIENCE FOUNDATION  
and  
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Canada/Australia Consortium for the Ocean Drilling Program, Department of Energy, Mines and Resources (Canada), and Department of Primary Industries and Energy (Australia)  
Deutsche Forschungsgemeinschaft (Federal Republic of Germany)  
European Science Foundation Consortium for Ocean Drilling (Belgium, Denmark, Finland, Greece, Iceland, Italy, The Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)  
Institut Français de Recherche pour l'Exploitation de la Mer (France)  
National Science Foundation (United States)  
Natural Environment Research Council (United Kingdom)  
University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

It is recommended that reference to the whole or to part of this volume be made in one of the following forms, as appropriate:

#### Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is correct.

The mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 155 (*Initial Reports*): July 1995  
Volume 156 (*Initial Reports*): September 1995  
Volume 157 (*Initial Reports*): November 1995  
Volume 138 (*Scientific Results*): August 1995  
Volume 141 (*Scientific Results*): September 1995  
Volume 146, Pt. 2 (*Scientific Results*): October 1995

#### Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547, U.S.A. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

# Foreword

By the National Science Foundation

The National Science Foundation is proud to play a leading role in partnership with the U.S. oceanographic community in the operation and management of the Ocean Drilling Program (ODP). We are equally proud of the cooperation and commitment of our international partners, who contribute both financial and intellectual resources required to maintain the high quality of this unique program. The Ocean Drilling Program, like its predecessor, the Deep Sea Drilling Project (DSDP), is a model for the organization and planning of research to address global scientific problems that are of high priority internationally and of long-term interest to the scientific community and general public.

Major scientific themes guiding the development of specific drilling cruises range from determining the causes and effects of oceanic and climatic variability to understanding the circulation of fluids in the ocean crust and the resultant formation of mineral deposits. Although such studies are at the forefront of basic scientific inquiry into the processes that control and modify the global environment, they are equally important in providing the background for assessing man's impact on the global environment or for projecting resource availability for future generations.

The transition from the DSDP to the ODP was marked by a number of changes. The 471-foot *JOIDES Resolution*, which replaced the *Glomar Challenger*, has allowed larger scientific parties and the participation of more graduate students, a larger laboratory and technical capability, and operations in more hostile ocean regions. The *JOIDES Resolution* has drilled in all of the world's oceans, from the marginal ice regions of the Arctic to within sight of the Antarctic continent. Over 1,200 scientists and students from 26 nations have participated on project cruises. Cores recovered from the cruises and stored in ODP repositories in the United States and Europe have provided samples to an additional 1,000 scientists for longer term post-cruise research investigations. The downhole geochemical and geophysical logging program, unsurpassed in either academia or industry, is providing remarkable new data with which to study the Earth.

In 1994, NSF and our international partners renewed our commitment to the program for its final phase. Of the 20 countries that supported ODP initially, only one, Russia, has been unable to continue for financial reasons. As the reputation and scientific impact of the program continue to grow internationally, we hope to add additional members and new scientific constituencies. This global scientific participation continues to assure the program's scientific excellence by focusing and integrating the combined scientific knowledge and capabilities of its member nations.

We wish the program smooth sailing and good drilling!

Neal Lane  
Director  
National Science Foundation

Arlington, Virginia

# Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents scientific and engineering results from the Ocean Drilling Program (ODP). The papers presented here address the scientific and technical goals of the program, which include providing a global description of geological and geophysical structures including passive and active margins and sediment history, and studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations.

The Ocean Drilling Program, an international activity, operates a specially equipped deep-sea drilling ship, the *JOIDES Resolution* (Sedco/BP 471), which contains state-of-the-art laboratories, equipment, and computers. The ship is 471 feet (144 meters) long, is 70 feet (21 meters) wide, and has a displacement of 18,600 short tons. Her derrick towers 211 feet (64 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 51 and a ship's crew (including the drill crew) of 62. The size and ice-strengthening of the ship allow drilling in high seas and ice-infested areas as well as permit a large group of multidisciplinary scientists to interact as part of the scientific party.

Logging, or measurements in the drilled holes, is an important part of the program. ODP provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiewer is available for imaging the wall of the hole, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the wall of the hole, and a vertical seismic profiler can record reflectors from below the total depth of the hole.

The management of the Ocean Drilling Program involves a partnership of scientists and governments. International oversight and coordination are provided by the ODP Council, a governmental consultative body of the partner countries, which is chaired by a representative from the United States National Science Foundation. The ODP Council periodically reviews the general progress of the program and discusses financial plans and other management issues. Overall scientific and management guidance is provided to the operators of the program by representatives from the group of institutions involved in the program, called the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES).

The Executive Committee (EXCOM), made up of the administrative heads of the JOIDES institutions, provides general oversight for ODP. The Planning Committee (PCOM), with its advisory structure, is made up of working scientists and provides scientific advice and detailed planning. PCOM has a network of panels and working groups that screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical-survey data and other safety and siting information. PCOM uses the recommendations of the panels and committees to select drilling targets, to specify the location and major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists.

Joint Oceanographic Institutions, Inc. (JOI), a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor for ODP. JOI is responsible for seeing that the scientific objectives, plans, and recommendations of the JOIDES committees are translated into scientific operations consistent with scientific advice and budgetary constraints. JOI subcontracts the operations of the program to two universities: Texas A&M University and Lamont-Doherty Earth Observatory

of Columbia University. JOI is also responsible for managing the U.S. contribution to ODP.

Texas A&M University (TAMU) serves as science operator for ODP. In this capacity, TAMU is responsible for planning the specific ship operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the relevant panels. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and computers and by providing logistical and technical support for shipboard scientific teams. Onshore, TAMU manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of scientific results.

Lamont-Doherty Earth Observatory (LDEO) of Columbia University is responsible for the program's logging operation, including processing the data and providing assistance to scientists for data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDEO.

Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at four sites: ODP Pacific and Indian Ocean cores at TAMU, DSDP Pacific and Indian Ocean cores at the Scripps Institution of Oceanography, ODP and DSDP Atlantic and Antarctic cores through Leg 150 at LDEO, and ODP Atlantic and Antarctic cores since Leg 151 at the University of Bremen, Federal Republic of Germany.

Scientific achievements of ODP include new information on early seafloor spreading and how continents separate and the margins evolve. The oldest Pacific crust has been drilled and sampled. We have new insights into glacial cycles and the fluctuations of ocean currents throughout geological time. Many of the scientific goals can be met only with new technology; thus the program has focused on engineering as well as science. To date, ODP engineers have demonstrated the capability to drill on bare rock at mid-ocean-ridge sites and have developed techniques for drilling in high-temperature and corrosive regions typical of hydrothermal vent areas. A new diamond coring system promises better core recovery in difficult areas.

In addition, ODP is cooperating closely with other geological and geophysical programs; for example, in 1991 the first hole was drilled by ODP for emplacement of a seismometer near Hawaii for the Ocean Seismic Network. JOI is pleased to have been able to play a facilitating role in the Ocean Drilling Program and its cooperative activities, and we are looking forward to many new results to come.

D. James Baker  
President  
Joint Oceanographic Institutions, Inc.

Washington, D.C.

# Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

*Scientific Results* volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly.

In acknowledgment of the contributions made by this volume's Editorial Review Board, the members of the Board are designated Editors of the volume and are listed on the title page as well. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

Philip D. Rabinowitz  
Director  
Ocean Drilling Program  
Texas A&M University

College Station, Texas

## **Publisher's Notes**

Current policy requires that artwork published in *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* be furnished by authors in final camera-ready form.

Abbreviations for names of organizations and publications in ODP reference lists follow the style given in *Chemical Abstracts Service Source Index* (published by American Chemical Society).

# TABLE OF CONTENTS

## VOLUME 146—SCIENTIFIC RESULTS PART 1: CASCADIA MARGIN

### SECTION 1: SEDIMENTOLOGY

1. Grain-size analysis and distribution in Cascadia Margin sediments, northeastern Pacific ..... 3  
A. Camerlenghi, R.G. Lucchi, and R.G. Rothwell
2. Coarse fraction minerals of sands in Cascadia Margin sediments ..... 33  
N.P. Chamov and I.O. Murdmaa

### SECTION 2: MICROPALEONTOLOGY

3. Radiolarians from the Cascadia Margin, Leg 146. .... 47  
J.-P. Caulet
4. Neogene diatom biostratigraphy of Site 892, Cascadia Margin ..... 63  
E. Fournanier
5. Foraminiferal biofacies, paleoenvironments, and biostratigraphy of Neogene–Quaternary  
sediments, Cascadia Margin ..... 79  
S.D. Zellers

### SECTION 3: DIAGENETIC DEPOSITS

6. Diagenetic carbonates from Cascadia Margin: textures, chemical compositions,  
and oxygen and carbon stable isotope signatures ..... 117  
A. Kopf, J.C. Sample, P. Bauer, J.H. Behrmann, and H. Erlenkeuser
7. Isotope geochemistry of syntectonic carbonate cements and veins from the Oregon Margin:  
implications for the hydrogeologic evolution of the accretionary wedge ..... 137  
J.C. Sample and A. Kopf

### SECTION 4: GAS HYDRATES

8. Gas hydrate and sediment gas composition, Hole 892A. .... 151  
M. Hovland, D. Lysne, and M. Whiticar
9. Seismic studies of methane gas hydrate, offshore Vancouver Island ..... 163  
G.D. Spence, T.A. Minshull, and C. Fink
10. Relation between pore fluid chemistry and gas hydrates associated with bottom-simulating  
reflectors at the Cascadia Margin, Sites 889 and 892 ..... 175  
M. Kastner, K.A. Kvenvolden, M.J. Whiticar, A. Camerlenghi, and T.D. Lorenson

### SECTION 5: MICROSTRUCTURES AND FABRICS

11. CT scan analysis of sediments from Leg 146 ..... 191  
J. Ashi

12. Microstructures in accreted sediments of the Cascadia Margin . . . . .	201
B. Clennell and A. Maltman	
13. Microstructural analysis of Sites 891 and 892: implications for deformation processes at the frontal thrust and an out-of-sequence thrust. . . . .	217
P.A. Teas, H.J. Tobin, and P.E. García	
14. Magnetic anisotropy fabrics from the Cascadia accretionary prism . . . . .	233
B.A. Housen and T. Sato	

**SECTION 6: PHYSICAL PROPERTIES AND HYDROGEOLOGY**

15. Dewatering of sediments along the Cascadia Margin: evidence from geotechnical properties . . . .	257
P. Hempel	
16. Permeability and stress history of sediment from the Cascadia Margin . . . . .	275
K. Moran, W.G.D. Gray, and C.A. Jarrett	
17. The variation of the hydraulic conductivity structure of an overpressured thrust zone with effective stress . . . . .	281
K.M. Brown	
18. In situ permeability tests at Site 892: characteristics of a hydrogeologically active fault zone on the Oregon accretionary prism. . . . .	291
E.J. Screaton, B. Carson, and G.P. Lennon	
19. Long-term observations of pressure and temperature in Hole 892B, Cascadia accretionary prism . . . . .	299
E.E. Davis, K. Becker, K. Wang, and B. Carson	
20. Log-based porosity of ODP sites on the Cascadia accretionary prism . . . . .	313
R.D. Jarrard, M.E. MacKay, G.K. Westbrook, and E.J. Screaton	
21. Seismic velocities at Site 891 from a vertical seismic profile experiment . . . . .	337
G.F. Moore, J. Dellinger, M.E. MacKay, and H. Hoskins	
22. Laboratory measurement of velocity vs. effective stress in thrust faults of the Oregon accretionary prism: implications for fault zone overpressure . . . . .	349
H.J. Tobin, J.C. Moore, and G.F. Moore	
23. Frontal thrust, Oregon accretionary prism: geometry, physical properties, and fluid pressure. . . .	359
J.C. Moore, K. Moran, M.E. MacKay, and H. Tobin	

**SECTION 7: SYNTHESSES**

24. Siliceous microfossil stratigraphic synthesis of Site 892, Cascadia Margin . . . . .	369
E. Fourtanier and J.-P. Caulet	
25. Geochemical evidence for fluid flow and diagenesis at the Cascadia convergent margin . . . . .	375
M. Kastner, J.C. Sample, M.J. Whiticar, M. Hovland, B.A. Cragg, and J.R. Parkes	
26. Organic geochemistry of gases, fluids, and hydrates at the Cascadia accretionary margin. . . . .	385
M.J. Whiticar, M. Hovland, M. Kastner, and J.C. Sample	

27. The impact of fluid and gas venting on bacterial populations and processes in sediments from the Cascadia Margin accretionary system (Sites 888–892) and the geochemical consequences . . . 399  
 B.A. Cragg, R.J. Parkes, J.C. Fry, A.J. Weightman, P.A. Rochelle, J.R. Maxwell, M. Kastner, M. Hovland, M.J. Whiticar, and J.C. Sample

28. Modern fluid flow in the Cascadia accretionary wedge: a synthesis . . . . . 413  
 B. Carson and G.K. Westbrook

**SECTION 8: DATA REPORTS**

29. *Data Report: Provenance analysis of Quaternary sands and sandstones from Cascadia Margin* . . . . . 425  
 J.H. Behrmann, P. Bauer, and A. Kopf

30. *Data Report: Chemical and isotopic compositions of pore fluids in sediments of the Cascadia accretionary complex* . . . . . 431  
 M. Kastner and H. Elderfield

31. *Data Report: Molecular and stable isotope analyses of sorbed and free hydrocarbon gases of Leg 146, Cascadia and Oregon Margins* . . . . . 439  
 M.J. Whiticar and M. Hovland

32. *Data Report: Anisotropy of magnetic susceptibility of a set of samples from the Cascadia Margin* . . . . . 451  
 W.H. Owens

**SECTION 9: REPRINT**

33. Origin of bottom-simulating reflectors: geophysical evidence from the Cascadia accretionary prism . . . . . 457  
 M.E. MacKay, R.D. Jarrard, G.K. Westbrook, R.D. Hyndman, and Shipboard Scientific Party of Ocean Drilling Program Leg 146

34. Technical notes and additions to: origin of bottom-simulating reflectors: geophysical evidence from the Cascadia accretionary prism . . . . . 461  
 M.E. MacKay, R.D. Jarrard, G.K. Westbrook, R.D. Hyndman, and Shipboard Scientific Party of Ocean Drilling Program Leg 146

**SECTION 10: INDEX**

Index . . . . . 467  
 (For JOIDES Advisory Groups and ODP Sample-Distribution Policy, please see *ODP Proceedings, Scientific Results*, Volume 143, pp. 601–608.)

**BACK-POCKET MATERIALS**

**Oversized Figure**

Seismic reflection line through Hole 892B.

**CD-ROM**

The CD-ROM in the back of this volume contains an electronic version of this volume and Leg 146 *Scientific Results* Part 2 in Adobe Acrobat. The indexes for all published *Proceedings* volumes are included in Acrobat format, along with the Acrobat Search engine. The Chapter 15 appendix is also on this CD in ASCII format. The Acrobat Reader 2.1 is included for installation on a personal computer (386-based or higher) running Windows 3.1 or a Macintosh computer (68020 or later processor).

For a complete list of files on this CD, refer to the README.TXT and README.PDF files on the disk.

**Scientific Results, Vol. 146 (Pt. 1), Directory Structure:**

Data (ASCII data files of appendixes and tables within the volume):

Chapter 4:

Appendix. Color data sets for Holes 893A and 893B.

Chapter 8:

Appendix. Analytical CaCO<sub>3</sub> and C<sub>org</sub> data from Santa Barbara Basin, Hole 893A.

Chapter 9:

Table 1. Summary table of Hole 893A data.

Chapter 11:

Appendix A. Magnetic susceptibility measurements, Hole 893A.

Appendix B. Magnetic susceptibility measurements, Hole 893B.

Chapter 27:

Appendix. Detailed lithostratigraphic log of sediment facies.
