Millimeter- to submillimeter-scale laminations and massive clay-rich beds of olive silty clay (lithological Subunit 1C) from Section 146-893A-6H-6, 0–45 cm (left), and Section 146-893A-7H-2, 0–45 cm (right).
This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Canada/Australia Consortium for the Ocean Drilling Program, Department of Energy, Mines and Resources (Canada), and Department of Primary Industries and Energy (Australia)
Deutsche Forschungsgemeinschaft (Federal Republic of Germany)
European Science Foundation Consortium for Ocean Drilling (Belgium, Denmark, Finland, Greece, Iceland, Italy, The Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)
Institut Français de Recherche pour l’Exploitation de la Mer (France)
National Science Foundation (United States)
Natural Environment Research Council (United Kingdom)
University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

Reference to the whole or to part of this volume should be made as follows:

Effective Publication Dates of ODP Proceedings

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, not the printed date, is correct.

The mailing dates of recent Proceedings of the Ocean Drilling Program are as follows:

Volume 154 (Initial Reports): May 1995
Volume 155 (Initial Reports): July 1995
Volume 156 (Initial Reports): September 1995
Volume 137/140 (Scientific Results): June 1995
Volume 138 (Scientific Results): August 1995
Volume 141 (Scientific Results): September 1995

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547, U.S.A. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Foreword
By the National Science Foundation

The National Science Foundation is proud to play a leading role in partnership with the U.S. oceanographic community in the operation and management of the Ocean Drilling Program (ODP). We are equally proud of the cooperation and commitment of our international partners, who contribute both financial and intellectual resources required to maintain the high quality of this unique program. The Ocean Drilling Program, like its predecessor, the Deep Sea Drilling Project (DSDP), is a model for the organization and planning of research to address global scientific problems that are of high priority internationally and of long-term interest to the scientific community and general public.

Major scientific themes guiding the development of specific drilling cruises range from determining the causes and effects of oceanic and climatic variability to understanding the circulation of fluids in the ocean crust and the resultant formation of mineral deposits. Although such studies are at the forefront of basic scientific inquiry into the processes that control and modify the global environment, they are equally important in providing the background for assessing man's impact on the global environment or for projecting resource availability for future generations.

The transition from the DSDP to the ODP was marked by a number of changes. The 471-foot JOIDES Resolution, which replaced the Glomar Challenger, has allowed larger scientific parties and the participation of more graduate students, a larger laboratory and technical capability, and operations in more hostile ocean regions. The JOIDES Resolution has drilled in all of the world's oceans, from the marginal ice regions of the Arctic to within sight of the Antarctic continent. Over 1,200 scientists and students from 26 nations have participated on project cruises. Cores recovered from the cruises and stored in ODP repositories in the United States and Europe have provided samples to an additional 1,000 scientists for longer term post-cruise research investigations. The downhole geochemical and geophysical logging program, unsurpassed in either academia or industry, is providing remarkable new data with which to study the Earth.

In 1994, NSF and our international partners renewed our commitment to the program for its final phase. Of the 20 countries that supported ODP initially, only one, Russia, has been unable to continue for financial reasons. As the reputation and scientific impact of the program continue to grow internationally, we hope to add additional members and new scientific constituencies. This global scientific participation continues to assure the program's scientific excellence by focusing and integrating the combined scientific knowledge and capabilities of its member nations.

We wish the program smooth sailing and good drilling!

Neal Lane
Director
National Science Foundation

Arlington, Virginia
This volume presents scientific and engineering results from the Ocean Drilling Program (ODP). The papers presented here address the scientific and technical goals of the program, which include providing a global description of geological and geophysical structures including passive and active margins and sediment history, and studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations.

The Ocean Drilling Program, an international activity, operates a specially equipped deep-sea drilling ship, the JOIDES Resolution (Sedco/BP 471), which contains state-of-the-art laboratories, equipment, and computers. The ship is 471 feet (144 meters) long, is 70 feet (21 meters) wide, and has a displacement of 18,600 short tons. Her derrick towers 211 feet (64 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 51 and a ship's crew (including the drill crew) of 62. The size and ice-strengthening of the ship allow drilling in high seas and ice-infested areas as well as permit a large group of multidisciplinary scientists to interact as part of the scientific party.

Logging, or measurements in the drilled holes, is an important part of the program. ODP provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a borehole televiewer is available for imaging the wall of the hole, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the wall of the hole, and a vertical seismic profiler can record reflectors from below the total depth of the hole.

The management of the Ocean Drilling Program involves a partnership of scientists and governments. International oversight and coordination are provided by the ODP Council, a governmental consultative body of the partner countries, which is chaired by a representative from the United States National Science Foundation. The ODP Council periodically reviews the general progress of the program and discusses financial plans and other management issues. Overall scientific and management guidance is provided to the operators of the program by representatives from the group of institutions involved in the program, called the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES).

The Executive Committee (EXCOM), made up of the administrative heads of the JOIDES institutions, provides general oversight for ODP. The Planning Committee (PCOM), with its advisory structure, is made up of working scientists and provides scientific advice and detailed planning. PCOM has a network of panels and working groups that screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical-survey data and other safety and siting information. PCOM uses the recommendations of the panels and committees to select drilling targets, to specify the location and major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists.

Joint Oceanographic Institutions, Inc. (JOI), a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor for ODP. JOI is responsible for seeing that the scientific objectives, plans, and recommendations of the JOIDES committees are translated into scientific operations consistent with scientific advice and budgetary constraints. JOI subcontracts the operations of the program to two universities: Texas A&M University and Lamont-Doherty Earth Observatory
of Columbia University. JOI is also responsible for managing the U.S. contribution to ODP.

Texas A&M University (TAMU) serves as science operator for ODP. In this capacity, TAMU is responsible for planning the specific ship operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the relevant panels. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and computers and by providing logistical and technical support for shipboard scientific teams. Onshore, TAMU manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of scientific results.

Lamont-Doherty Earth Observatory (LDEO) of Columbia University is responsible for the program’s logging operation, including processing the data and providing assistance to scientists for data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDEO.

Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at four sites: ODP Pacific and Indian Ocean cores at TAMU, DSDP Pacific and Indian Ocean cores at the Scripps Institution of Oceanography, ODP and DSDP Atlantic and Antarctic cores through Leg 150 at LDEO, and ODP Atlantic and Antarctic cores since Leg 151 at the University of Bremen, Federal Republic of Germany.

Scientific achievements of ODP include new information on early seafloor spreading and how continents separate and the margins evolve. The oldest Pacific crust has been drilled and sampled. We have new insights into glacial cycles and the fluctuations of ocean currents throughout geological time. Many of the scientific goals can be met only with new technology; thus the program has focused on engineering as well as science. To date, ODP engineers have demonstrated the capability to drill on bare rock at mid-ocean-ridge sites and have developed techniques for drilling in high-temperature and corrosive regions typical of hydrothermal vent areas. A new diamond coring system promises better core recovery in difficult areas.

In addition, ODP is cooperating closely with other geological and geophysical programs; for example, in 1991 the first hole was drilled by ODP for emplacement of a seismometer near Hawaii for the Ocean Seismic Network. JOI is pleased to have been able to play a facilitating role in the Ocean Drilling Program and its cooperative activities, and we are looking forward to many new results to come.

D. James Baker
President
Joint Oceanographic Institutions, Inc.

Washington, D.C.
The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author’s research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a *Scientific Results* volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

*Scientific Results* volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly.

In acknowledgment of the contributions made by this volume’s Editorial Review Board, the members of the Board are designated Editors of the volume and are listed on the title page as well. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the *Proceedings*.

Publisher’s Notes

Current policy requires that artwork published in Scientific Results volumes of the Proceedings of the Ocean Drilling Program be furnished by authors in final camera-ready form.

Abbreviations for names of organizations and publications in ODP reference lists follow the style given in Chemical Abstracts Service Source Index (published by American Chemical Society).

* At time of publication.
**TABLE OF CONTENTS**

**VOLUME 146—SCIENTIFIC RESULTS**
**PART 2: SANTA BARBARA BASIN**

**SECTION 1: ISOTOPIC STRATIGRAPHY AND CHRONOLOGY**

1. Latest Quaternary benthic oxygen and carbon isotope stratigraphy: Hole 893A, Santa Barbara Basin, California ................................................................. 3
   J.P. Kennett

2. Radiocarbon chronology and planktonic-benthic foraminiferal $^{14}$C age differences in Santa Barbara Basin sediments, Hole 893A ........................................... 19
   B.L. Ingram and J.P. Kennett

**SECTION 2: SEDIMENTS AND PHYSICAL PROPERTIES**

3. Late Pleistocene–Holocene climatic cycles recorded in Santa Barbara Basin sediments: interpretation of color density logs from Site 893 ........................................ 31
   M. Schaaf and J. Thurow

4. The ODP color digital imaging system: color logs of Quaternary sediments from the Santa Barbara Basin, Site 893 ............................................................ 45
   R.B. Merrill and J.W. Beck

5. Provenance of sand deposited in the Santa Barbara Basin at Site 893 during the last 155,000 years ................................................................. 61
   K.M. Marsaglia, K.C. Rimkus, and R.J. Behl

6. Composition and origins of laminae in late Quaternary and Holocene sediments from the Santa Barbara Basin ......................................................... 77
   D. Bull and A.E.S. Kemp

7. Clay and bulk mineralogy of late Quaternary sediments at Site 893, Santa Barbara Basin ........ 89
   R. Stein

8. Centennial-scale late Quaternary stratigraphies of carbonate and organic carbon from Santa Barbara Basin, Hole 893A, and their paleoceanographic significance ................................................. 103
   J.V. Gardner and P. Dartnell

9. A 160,000-year high-resolution record of quantity and composition of organic carbon in the Santa Barbara Basin (Site 893) .................................................. 125
   R. Stein and F.R. Rack

10. Bacterial profiles in deep sediments of the Santa Barbara Basin, Site 893 ....................... 139

11. Magnetic susceptibility and physical properties of sediment cores from Site 893, Santa Barbara Basin: records of sediment diagenesis or of paleoclimatic and paleoceanographic change? ................................................................. 145
    F.R. Rack, E.A. Heise, and R. Stein

12. Interhole correlations at Site 893, Santa Barbara Basin: construction of a 16,000-year composite record using magnetic susceptibility and digital color imaging data ........ 169
    F.R. Rack and R.B. Merrill
13. Effects of gas and core handling on measurements of compressional wave velocity in Site 893 cores .......................................................... 193
N.C. Slowey and W.R. Bryant

SECTION 3: ORGANIC GEOCHEMISTRY

K.-U. Hinrichs, J. Rullkötter, and R. Stein

15. Episodically strong recycling of methane recorded by $^{13}\text{C}/^{12}\text{C}$, N/C, and H/C ratios for kerogens from the last 160,000 years in the Santa Barbara Basin at Hole 893A ...................... 213
L.M. Pratt, A.M. Carmo, V. Brüchert, S.M. Monk, and J.M. Hayes

16. Abundance and isotopic composition of organic and inorganic sulfur species in laminated and bioturbated sediments from Hole 893A, Santa Barbara Basin .................. 219
V. Brüchert, L.M. Pratt, T.F. Anderson, and S.R. Hoffmann

SECTION 4: PALEOCEANOGRAPHY AND PALEONTOLOGY

17. A diatom record spanning 114,000 years from Site 893, Santa Barbara Basin .................. 233
E. Hemphill-Haley and E. Fourtanier

18. Autochthonous and allochthonous Quaternary Ostracoda from Site 893, Santa Barbara Basin .......................... 251
R. Whatley and I. Boomer

19. Glacial-interglacial sea-surface temperature record inferred from alkenone unsaturation indices, Site 893, Santa Barbara Basin .................. 257
T.D. Herbert, M. Yasuda, and C. Burnett

20. Pollen stratigraphy and paleoecologic interpretation of the 160-k.y. record from Santa Barbara Basin, Hole 893A .................. 265
L.E. Heusser

21. Late Quaternary climatically related planktonic foraminiferal assemblage changes: Hole 893A, Santa Barbara Basin, California .......................... 281
J.P. Kennett and K. Venz

22. Sedimentary facies and sedimentology of the late Quaternary Santa Barbara Basin, Site 893 .......................................................... 295
R.J. Behl

23. Paleoclimatic evolution of Santa Barbara Basin during the last 20 k.y.: marine evidence from Hole 893A .......................... 309
J.P. Kennett and B.L. Ingram

SECTION 5: DATA REPORTS

W. Wei and A. Peleo-Alampay

25. Data Report: Chemistry of pore fluids in sediments of Hole 893B, Santa Barbara Basin .......................... 331
M. Kastner

26. Data Report: X-radiography of selected, predominantly varved intervals at Hole 893A .......................... 333
C.B. Lange and A. Schimmelmann

SECTION 6: INDEX

Index .................................................................................................................. 355

(For JOIDES Advisory Groups and ODP Sample Distribution Policy, please see ODP Proceedings, Scientific Results, Volume 143, pp. 601-608.)
