Prepared by the
OCEAN DRILLING PROGRAM
TEXAS A&M UNIVERSITY

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.
Foreword
By the National Science Foundation

The National Science Foundation is proud to play a leading role in partnership with the U.S. oceanographic community in the operation and management of the Ocean Drilling Program (ODP). We are equally proud of the cooperation and commitment of our international partners, who contribute both financial and intellectual resources required to maintain the high quality of this unique program. The Ocean Drilling Program, like its predecessor, the Deep Sea Drilling Project (DSDP), is a model for the organization and planning of research to address global scientific problems that are of high priority internationally and of long-term interest to the scientific community and general public.

Major scientific themes guiding the development of specific drilling cruises range from determining the causes and effects of oceanic and climatic variability to understanding the circulation of fluids in the ocean crust and the resultant formation of mineral deposits. Although such studies are at the forefront of basic scientific inquiry into the processes that control and modify the global environment, they are equally important in providing the background for assessing man's impact on the global environment or for projecting resource availability for future generations.

The transition from the DSDP to the ODP was marked by a number of changes. The 471-foot JOIDES Resolution, which replaced the Glomar Challenger, has allowed larger scientific parties and the participation of more graduate students, a larger laboratory and technical capability, and operations in more hostile ocean regions. The JOIDES Resolution has drilled in all of the world's oceans, from the marginal ice regions of the Arctic to within sight of the Antarctic continent. Over 1,200 scientists and students from 26 nations have participated on project cruises. Cores recovered from the cruises and stored in ODP repositories in the United States and Europe have provided samples to an additional 1,000 scientists for longer term post-cruise research investigations. The downhole geochemical and geophysical logging program, unsurpassed in either academia or industry, is providing remarkable new data with which to study the Earth.

In 1994, NSF and our international partners renewed our commitment to the program for its final phase. Of the 20 countries that supported ODP initially, only one, Russia, has been unable to continue for financial reasons. As the reputation and scientific impact of the program continue to grow internationally, we hope to add additional members and new scientific constituencies. This global scientific participation continues to assure the program's scientific excellence by focusing and integrating the combined scientific knowledge and capabilities of its member nations.

We wish the program smooth sailing and good drilling!

Neal Lane
Director
National Science Foundation

Arlington, Virginia
Foreword
By Joint Oceanographic Institutions, Inc.

This volume presents scientific and engineering results from the Ocean Drilling Program (ODP). The papers presented here address the scientific and technical goals of the program, which include providing a global description of geological and geophysical structures including passive and active margins and sediment history, and studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations.

The Ocean Drilling Program, an international activity, operates a specially equipped deep-sea drilling ship, the JOIDES Resolution (Sedco/BP 471), which contains state-of-the-art laboratories, equipment, and computers. The ship is 471 feet (144 meters) long, is 70 feet (21 meters) wide, and has a displacement of 18,600 short tons. Her derrick towers 211 feet (64 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 51 and a ship's crew (including the drill crew) of 62. The size and ice-strengthening of the ship allow drilling in high seas and ice-infested areas as well as permit a large group of multidisciplinary scientists to interact as part of the scientific party.

Logging, or measurements in the drilled holes, is an important part of the program. ODP provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a Formation MicroScanner is available for high-resolution imaging the wall of the hole, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the wall of the hole, and a vertical seismic profiler can record reflectors from below the total depth of the hole.

The management of the Ocean Drilling Program involves a partnership of scientists and governments. International oversight and coordination are provided by the ODP Council, a governmental consultative body of the partner countries, which is chaired by a representative from the United States National Science Foundation (NSF). The ODP Council periodically reviews the general progress of the program and discusses financial plans and other management issues. Overall scientific and management guidance is provided to the operators of the program by representatives from the group of institutions involved in the program, called the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES).

The Executive Committee (EXCOM), made up of the administrative heads of the JOIDES institutions, provides general oversight for ODP. The Planning Committee (PCOM), with its advisory structure, is made up of working scientists and provides scientific advice and detailed planning. PCOM has a network of panels and working groups that screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical-survey data and other safety and siting information. PCOM uses the recommendations of the panels and committees to select drilling targets, to specify the location and major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists.

Joint Oceanographic Institutions, Inc. (JOI), a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor for ODP. JOI is responsible for seeing that the scientific objectives, plans, and recommendations of the JOIDES committees are translated into scientific operations consistent with scientific advice and budgetary constraints. JOI subcontracts the operations of the program to two universities: Texas A&M University and Lamont-Doherty Earth Observatory.
of Columbia University. JOI is also responsible for managing the U.S. contribution to ODP under a separate cooperative agreement with NSF.

Texas A&M University (TAMU) serves as science operator for ODP. In this capacity, TAMU is responsible for planning the specific ship operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the relevant panels. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and computers and by providing logistical and technical support for shipboard scientific teams. Onshore, TAMU manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of scientific results.

Lamont-Doherty Earth Observatory (LDEO) of Columbia University is responsible for the program’s logging operation, including processing the data and providing assistance to scientists for data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDEO.

Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at four sites: ODP Pacific and Indian Ocean cores at TAMU, DSDP Pacific and Indian Ocean cores at the Scripps Institution of Oceanography, ODP and DSDP Atlantic and Antarctic cores through Leg 150 at LDEO, and ODP Atlantic and Antarctic cores since Leg 151 at the University of Bremen, Federal Republic of Germany.

Scientific achievements of ODP include new information on early seafloor spreading and how continents separate and the margins evolve. The oldest Pacific crust has been drilled and sampled. We have new insights into glacial cycles and the fluctuations of ocean currents throughout geological time. ODP has also provided valuable data that shed light on fluid pathways through the lithosphere, global climate change both in the Arctic and near the equator, past sea-level change, seafloor mineralization, the complex tectonic evolution of oceanic crust, and the evolution of passive continental margins.

Many of the scientific goals can be met only with new technology; thus the program has focused on engineering as well as science. To date, ODP engineers have demonstrated the capability to drill on bare rock at mid-ocean-ridge sites and have developed techniques for drilling in high-temperature and corrosive regions typical of hydrothermal vent areas. A new diamond coring system promises better core recovery in difficult areas. In a close collaborative effort between ODP engineers and scientists, a system has been developed that seals selected boreholes ("CORKs") and monitors downhole temperature, pressure, and fluid composition for up to three years. When possible, ODP is also taking advantage of industry techniques such as logging while drilling, to obtain continuous downhole information in difficult-to-drill formations.

JOI is pleased to have been able to play a facilitating role in the Ocean Drilling Program and its cooperative activities, and we are looking forward to many new, exciting results in the future.

James D. Watkins

Washington, D.C.
Preface

The Scientific Results volumes of the Proceedings of the Ocean Drilling Program contain specialty papers presenting the results of up to one and one-half years of research in various aspects of scientific ocean drilling. I acknowledge with thanks the authors of the papers published in this volume, who thereby have enabled future investigators to gain ready access to the results of their research.

Each of the papers submitted to a Scientific Results volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through one or more revision cycles before being accepted for publication. Our goal is to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

The Editorial Review Board for a Scientific Results volume is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the ODP staff editor assigned to the volume helps with any manuscripts that require special attention, such as those by authors who need assistance with English expression.

Scientific Results volumes may also contain short reports consisting of good data that are not ready for final interpretation. Papers in this category are segregated in a section in the back of the volume called Data Reports. Although no interpretation is permitted, these papers ordinarily contain a section on methodology or procedures. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques thoroughly.

In acknowledgment of the contributions made by this volume's Editorial Review Board, the members of the Board are designated Editors of the volume and are listed on the title page as well. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front portion of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving so generously of their time and efforts in ensuring that only papers of high scientific quality are published in the Proceedings.

PUBLISHER'S NOTES

Current policy requires that artwork published in Scientific Results volumes of the Proceedings of the Ocean Drilling Program be furnished by authors in final camera-ready form.

Abbreviations for names of organizations and publications in ODP reference lists follow the style given in Chemical Abstracts Service Source Index (published by American Chemical Society).
TABLE OF CONTENTS

VOLUME 147—SCIENTIFIC RESULTS

SECTION 1. IGNEOUS PETROLOGY

1. Petrology and geochemistry of gabbroic and related rocks from Site 894, Hess Deep............. 3
   R.B. Pedersen, J. Malpas, and T. Falloon

2. Melt migration through high-level gabbroic cumulates of the East Pacific Rise at Hess Deep:
   the origin of magma lenses and the deep crustal structure of fast-spreading ridges .............. 21
   J.H. Natland and H.J.B. Dick

3. Rare earth element constraints on the origin of amphibole in gabbroic rocks from Site 894,
   Hess Deep ................................................................. 59
   K.M. Gillis

4. Platinum-group-element concentrations in mafic and ultramafic lithologies drilled from
   Hess Deep ................................................................. 77
   H.M. Prichard, H. Puchelt, J.-D. Eckhardt, and P.C. Fisher

5. Sulfide mineralogy, sulfur content, and sulfur isotope composition of mafic and ultramafic
   rocks from Leg 147 ............................................................ 91
   H. Puchelt, H.M. Prichard, Z. Berner, and J. Maynard

6. Late-stage melt evolution and transport in the shallow mantle beneath the East Pacific Rise .... 103
   H.J.B. Dick and J.H. Natland

7. Petrology of gabbro-troctolite-peridotite complex from Hess Deep, equatorial Pacific:
   implications for mantle-melt interaction within the oceanic lithosphere ............................... 135
   S. Arai and K. Matsukage

8. Cr-rich spinel as a tracer for melt migration and melt–wall rock interaction in the mantle:
   Hess Deep, Leg 147 .......................................................... 157
   J.F. Allan and H.J.B. Dick

9. Petrology of selected Leg 147 basaltic lavas and dikes ....................................................... 173
   J.F. Allan, T. Falloon, R.B. Pedersen, B. Shankar Lakkapragada, J.H. Natland, and J. Malpas

SECTION 2. METAMORPHIC PETROLOGY

10. Fracture-controlled metamorphism of Hess Deep gabbros, Site 894: constraints on the roots of
    mid-ocean-ridge hydrothermal systems at fast-spreading centers ....................................... 189
    C.E. Manning and C.J. MacLeod

11. Melt-fluid evolution in gabbroic rocks from Hess Deep ..................................................... 213
    D.S. Kelley and J. Malpas

    high-temperature interaction of seawater with the oceanic crust layer 3 .............................. 227
    C. Lécuyer and G. Gruau

13. Mineralogic and stable isotope record of polyphase alteration of upper crustal gabbros of the
    East Pacific Rise (Hess Deep, Site 894) .............................................. 235
    G.L. Früh-Green, A. Plas, and L.N. Dell’Angelo
14. Petrologic and stable isotope constraints on hydrothermal alteration and serpentinization of
the EPR shallow mantle at Hess Deep (Site 895) .................................................. 255
G.L. Früh-Green, A. Plas, and C. Lécuyer

15. Hydrothermal alteration of the upper-mantle section at Hess Deep .................. 293
C. Mével and C. Stamoudi

16. (035) Sr and O isotopic ratios of aragonite veins from Site 895 .................. 311
J. Blusztajn and S.R. Hart

SECTION 3. STRUCTURAL GEOLOGY

17. Gabbro fabrics from Site 894, Hess Deep: implications for magma chamber processes at the
East Pacific Rise ................................................................. 317
C.J. MacLeod, F. Boudier, G. Yaouancq, and C. Richter

18. Constraints on the geometry and fracturing of Hole 894G, Hess Deep, from Formation
MicroScanner logging data .................................................. 329
B. Célérier, C.J. MacLeod, and P.K. Harvey

19. Structures in peridotites from Site 895, Hess Deep: implications for the geometry of mantle flow
beneath the East Pacific Rise .................................................. 347
F. Boudier, C.J. MacLeod, and L. Bolou

20. Structural history and significance of gabbroic rocks in the uppermost mantle: Hess Deep,
EPR (Site 895) ................................................................. 357

SECTION 4. MAGNETISM

21. Paleomagnetism and rock magnetic properties of gabbro from Hole 894G, Hess Deep ...... 373
J.E. Pariso, P. Kelso, and C. Richter

22. Paleomagnetism of gabbroic rocks and peridotites from Sites 894 and 895, Leg 147, Hess Deep:
results of half-core and whole-core measurements ............................................. 383
E. Kikawa, P.R. Kelso, J.E. Pariso, and C. Richter

23. Magnetic fabrics and sources of magnetic susceptibility in lower crustal and upper mantle rocks
from Hess Deep ................................................................. 393
C. Richter, P.R. Kelso, and C.J. MacLeod

24. Rock magnetic properties, magnetic mineralogy, and paleomagnetism of peridotites from
Site 895, Hess Deep ................................................................. 405
P.R. Kelso, C. Richter, and J.E. Pariso

SECTION 5. PHYSICAL PROPERTIES

25. Velocity behavior of lower crustal and upper mantle rocks from a fast-spreading ridge at
Hess Deep ................................................................. 417
G.J. Iturrino, D.J. Miller, and N.I. Christensen

SECTION 6. SEDIMENTS

26. Sediments and their geochemistry, Hess Deep ............................................. 443
J.-D. Eckhardt and H. Puchelt
27. Detrital minerals in surface sediments from Hess Deep, equatorial Pacific: implications for the lithologic spread of mafic-ultramafic rocks ........................................... 451
   S. Arai and N. Abe

SECTION 7. SYNTHESSES

28. Tectonics of Hess Deep: a synthesis of drilling results from Leg 147 ...................... 461
   C.J. MacLeod, B. Célérier, G.L. Früh-Green, and C.E. Manning

29. Geochemical and petrological constraints on velocity behavior of lower crustal and upper mantle rocks from the fast-spreading ridge at Hess Deep ......................... 477
   D.J. Miller, G.J. Iturrino, and N.I. Christensen

SECTION 8. DATA REPORTS

30. Data Report: Ultramafic reference material from Core 147-895D-10W ...................... 493
   H. Puchelt, J. Malpas, T. Falloon, R. Pedersen, J.-D. Eckhardt, and J.F. Allan

31. Data Report: Metamorphic veins from Site 894 .................................................. 497
   C.E. Manning, C.J. MacLeod, G.L. Früh-Green, D.S. Kelley, and C. Lécuyer

32. Data Report: Structural measurements from Sites 894 and 895, Hess Deep ................ 515

SECTION 9: INDEX

Index ..................................................................................................................... 533
