Robert B. Whitmarsh, Dale S. Sawyer, Adam Klaus, Douglas G. Masson

Prepared by the
OCEAN DRILLING PROGRAM
TEXAS A&M UNIVERSITY

Ruth N. Riegel
Volume Editor

in cooperation with the
NATIONAL SCIENCE FOUNDATION
and
JOINT OCEANOGRAPHIC INSTITUTIONS, INC.

This publication was prepared by the Ocean Drilling Program, Texas A&M University, as an account of work performed under the international Ocean Drilling Program, which is managed by Joint Oceanographic Institutions, Inc., under contract with the National Science Foundation. Funding for the program was provided by the following agencies at the time of this cruise:

Canada/Australia Consortium for the Ocean Drilling Program, Department of Energy, Mines and Resources (Canada), and Department of Primary Industries and Energy (Australia)
Deutsche Forschungsgemeinschaft (Federal Republic of Germany)
European Science Foundation Consortium for Ocean Drilling (Belgium, Denmark, Finland, Greece, Iceland, Italy, The Netherlands, Norway, Spain, Sweden, Switzerland, and Turkey)
Institut Français de Recherche pour l'Exploitation de la Mer (France)
National Science Foundation (United States)
Natural Environment Research Council (United Kingdom)
University of Tokyo, Ocean Research Institute (Japan)

Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation, the participating agencies, Joint Oceanographic Institutions, Inc., Texas A&M University, or Texas A&M Research Foundation.

Reference to the whole or to part of this volume should be made as follows:

- Whitmarsh, R.B., Sawyer, D.S., Klaus, A., and Masson, D.G. (Eds.), 1996. *Proc. ODP, Sci. Results*, 149: College Station, TX (Ocean Drilling Program).
- Pinheiro, L.M., Wilson, R.C.L., Pena dos Reis, R., Whitmarsh, R.B., and Ribeiro, A., 1996. The western Iberia Margin: a geophysical and geological overview. *In* Whitmarsh, R.B., Sawyer, D.S., Klaus, A., and Masson, D.G. (Eds.), *Proc. ODP, Sci. Results*, 149: College Station, TX (Ocean Drilling Program), 3-23.

Effective Publication Dates of ODP *Proceedings*

According to the International Code of Zoological Nomenclature, the date of publication of a work and of a contained name or statement affecting nomenclature is the date on which the publication was mailed to subscribers, placed on sale, or when the whole edition is distributed free of charge, mailed to institutions and individuals to whom free copies are distributed. The mailing date, *not the printed date*, is the correct one.

The mailing dates of recent *Proceedings of the Ocean Drilling Program* are as follows:

Volume 158 (*Initial Reports*): February 1996
Volume 159/159T (*Initial Reports*): March 1996
Volume 160 (*Initial Reports*): April 1996
Volume 146, Pt. 1 (*Scientific Results*): December 1995
Volume 147 (*Scientific Results*): April 1996
Volume 148 (*Scientific Results*): April 1996

Distribution

Copies of this publication may be obtained from Publications Distribution Center, Ocean Drilling Program, 1000 Discovery Drive, College Station, Texas 77845-9547, U.S.A. Orders for copies will require advance payment. See current ODP publication list for price and availability of this publication.

Foreword

By the National Science Foundation

The National Science Foundation is proud to play a leading role in partnership with the U.S. oceanographic community in the operation and management of the Ocean Drilling Program (ODP). We are equally proud of the cooperation and commitment of our international partners, who contribute both financial and intellectual resources required to maintain the high quality of this unique program. The Ocean Drilling Program, like its predecessor, the Deep Sea Drilling Project (DSDP), is a model for the organization and planning of research to address global scientific problems that are of high priority internationally and of long-term interest to the scientific community and general public.

Major scientific themes guiding the development of specific drilling cruises range from determining the causes and effects of oceanic and climatic variability to understanding the circulation of fluids in the ocean crust and the resultant formation of mineral deposits. Although such studies are at the forefront of basic scientific inquiry into the processes that control and modify the global environment, they are equally important in providing the background for assessing man's impact on the global environment or for projecting resource availability for future generations.

The transition from the DSDP to the ODP was marked by a number of changes. The 471-foot *JOIDES Resolution*, which replaced the *Glomar Challenger*, has allowed larger scientific parties and the participation of more graduate students, a larger laboratory and technical capability, and operations in more hostile ocean regions. The *JOIDES Resolution* has drilled in all of the world's oceans, from the marginal ice regions of the Arctic to within sight of the Antarctic continent. Over 1,200 scientists and students from 26 nations have participated on project cruises. Cores recovered from the cruises and stored in ODP repositories in the United States and Europe have provided samples to an additional 1,000 scientists for longer term post-cruise research investigations. The downhole geochemical and geophysical logging program, unsurpassed in either academia or industry, is providing remarkable new data with which to study the Earth.

In 1994, NSF and our international partners renewed our commitment to the program for its final phase. Of the 20 countries that supported ODP initially, only one, Russia, has been unable to continue for financial reasons. As the reputation and scientific impact of the program continue to grow internationally, we hope to add additional members and new scientific constituencies. This global scientific participation continues to assure the program's scientific excellence by focusing and integrating the combined scientific knowledge and capabilities of its member nations.

We wish the program smooth sailing and good drilling!

Neal Lane
Director
National Science Foundation

Arlington, Virginia

Foreword

By Joint Oceanographic Institutions, Inc.

This volume presents scientific and engineering results from the Ocean Drilling Program (ODP). The papers presented here address the scientific and technical goals of the program, which include providing a global description of geological and geophysical structures including passive and active margins and sediment history, and studying in detail areas of major geophysical activity such as mid-ocean ridges and the associated hydrothermal circulations.

The Ocean Drilling Program, an international activity, operates a specially equipped deep-sea drilling ship, the *JOIDES Resolution* (Sedco/BP 471), which contains state-of-the-art laboratories, equipment, and computers. The ship is 471 feet (144 meters) long, is 70 feet (21 meters) wide, and has a displacement of 18,600 short tons. Her derrick towers 211 feet (64 meters) above the waterline, and a computer-controlled dynamic-positioning system stabilizes the ship over a specific location while drilling in water depths up to 27,000 feet (8230 meters). The drilling system collects cores from beneath the seafloor with a derrick and drawworks that can handle 30,000 feet (9144 meters) of drill pipe. More than 12,000 square feet (1115 square meters) of space distributed throughout the ship is devoted to scientific laboratories and equipment. The ship sails with a scientific and technical crew of 51 and a ship's crew (including the drill crew) of 62. The size and ice-strengthening of the ship allow drilling in high seas and ice-infested areas as well as permit a large group of multidisciplinary scientists to interact as part of the scientific party.

Logging, or measurements in the drilled holes, is an important part of the program. ODP provides a full suite of geochemical and geophysical measurements for every hole deeper than 1300 feet (400 meters). For each such hole, there are lowerings of basic oil-industry tools: nuclear, sonic, and electrical. In addition, a Formation MicroScanner is available for high-resolution imaging the wall of the hole, a 12-channel logging tool provides accurate velocity and elastic property measurements as well as sonic waveforms for spectral analysis of energy propagation near the wall of the hole, and a vertical seismic profiler can record reflectors from below the total depth of the hole.

The management of the Ocean Drilling Program involves a partnership of scientists and governments. International oversight and coordination are provided by the ODP Council, a governmental consultative body of the partner countries, which is chaired by a representative from the United States National Science Foundation (NSF). The ODP Council periodically reviews the general progress of the program and discusses financial plans and other management issues. Overall scientific and management guidance is provided to the operators of the program by representatives from the group of institutions involved in the program, called the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES).

The Executive Committee (EXCOM), made up of the administrative heads of the JOIDES institutions, provides general oversight for ODP. The Planning Committee (PCOM), with its advisory structure, is made up of working scientists and provides scientific advice and detailed planning. PCOM has a network of panels and working groups that screen drilling proposals, evaluate instrumentation and measurement techniques, and assess geophysical-survey data and other safety and siting information. PCOM uses the recommendations of the panels and committees to select drilling targets, to specify the location and major scientific objectives of each two-month drilling segment or leg, and to provide the science operator with nominations for co-chief scientists.

Joint Oceanographic Institutions, Inc. (JOI), a nonprofit consortium of U.S. oceanographic institutions, serves as the National Science Foundation's prime contractor for ODP. JOI is responsible for seeing that the scientific objectives, plans, and recommendations of the JOIDES committees are translated into scientific operations consistent with scientific advice and budgetary constraints. JOI subcontracts the operations of the program to two universities: Texas A&M University and Lamont-Doherty Earth Observatory

of Columbia University. JOI is also responsible for managing the U.S. contribution to ODP under a separate cooperative agreement with NSF.

Texas A&M University (TAMU) serves as science operator for ODP. In this capacity, TAMU is responsible for planning the specific ship operations, actual drilling schedules, and final scientific rosters, which are developed in close cooperation with PCOM and the relevant panels. The science operator also ensures that adequate scientific analyses are performed on the cores by maintaining the shipboard scientific laboratories and computers and by providing logistical and technical support for shipboard scientific teams. Onshore, TAMU manages scientific activities after each leg, is curator for the cores, distributes samples, and coordinates the editing and publication of scientific results.

Lamont-Doherty Earth Observatory (LDEO) of Columbia University is responsible for the program's logging operation, including processing the data and providing assistance to scientists for data analysis. The ODP Data Bank, a repository for geophysical data, is also managed by LDEO.

Core samples from ODP and the previous Deep Sea Drilling Project are stored for future investigation at four sites: ODP Pacific and Indian Ocean cores at TAMU, DSDP Pacific and Indian Ocean cores at the Scripps Institution of Oceanography, ODP and DSDP Atlantic and Antarctic cores through Leg 150 at LDEO, and ODP Atlantic and Antarctic cores since Leg 151 at the University of Bremen, Federal Republic of Germany.

Scientific achievements of ODP include new information on early seafloor spreading and how continents separate and the margins evolve. The oldest Pacific crust has been drilled and sampled. We have new insights into glacial cycles and the fluctuations of ocean currents throughout geological time. ODP has also provided valuable data that shed light on fluid pathways through the lithosphere, global climate change both in the Arctic and near the equator, past sea-level change, seafloor mineralization, the complex tectonic evolution of oceanic crust, and the evolution of passive continental margins.

Many of the scientific goals can be met only with new technology; thus the program has focused on engineering as well as science. To date, ODP engineers have demonstrated the capability to drill on bare rock at mid-ocean-ridge sites and have developed techniques for drilling in high-temperature and corrosive regions typical of hydrothermal vent areas. A new diamond coring system promises better core recovery in difficult areas. In a close collaborative effort between ODP engineers and scientists, a system has been developed that seals selected boreholes ("CORKs") and monitors downhole temperature, pressure, and fluid composition for up to three years. When possible, ODP is also taking advantage of industry techniques such as logging while drilling, to obtain continuous downhole information in difficult-to-drill formations.

JOI is pleased to have been able to play a facilitating role in the Ocean Drilling Program and its cooperative activities, and we are looking forward to many new, exciting results in the future.

James D. Watkins
Admiral, U.S. Navy (Retired)
President
Joint Oceanographic Institutions, Inc.

Washington, D.C.

Preface

The *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* contain specialty papers presenting the results of extensive research in various aspects of scientific ocean drilling. The authors of the papers published in this volume have enabled future investigators to gain ready access to the results of their research, and I acknowledge their contributions with thanks.

Each paper submitted to a *Scientific Results* volume undergoes rigorous peer review by at least two specialists in the author's research field. A paper typically goes through at least one revision cycle before being accepted for publication. We seek to maintain a peer-review system comparable to those of the most highly regarded journals in the geological sciences.

Each *Scientific Results* volume has an Editorial Review Board that is responsible for obtaining peer reviews of papers submitted to the volume. This board usually is made up of the two co-chief scientists for the cruise, the ODP staff scientist for the cruise, and one external specialist who is familiar with the geology of the area investigated. In addition, the volume has an ODP staff editor who assists with manuscripts that require English-language attention and who coordinates volume assembly.

Scientific Results volumes may also contain short reports of useful data that are not ready for final interpretation. Papers of this type, which may be found together in a section in the back of the volume, are called Data Reports and include no interpretation of results. Data Report papers are read carefully by at least one specialist to make sure they are well organized, comprehensive, and discuss the techniques or procedures thoroughly.

To acknowledge the contributions made by this volume's Editorial Review Board, the Board members are designated Editors of the volume and are so listed on the title page. Reviewers of manuscripts for this volume, whose efforts are so essential to the success of the publication, are listed in the front of the book, without attribution to a particular manuscript.

On behalf of the Ocean Drilling Program, I extend sincere appreciation to members of the Editorial Review Boards and to the reviewers for giving their generous contribution of time and effort, which ensures that only papers of high scientific quality are published in the *Proceedings*.

PUBLISHER'S NOTES

Current policy requires that artwork published in *Scientific Results* volumes of the *Proceedings of the Ocean Drilling Program* be furnished by authors in final camera-ready form.

Abbreviations for names of organizations and publications in ODP reference lists follow the style given in *Chemical Abstracts Service Source Index* (published by American Chemical Society).

*At time of publication.

TABLE OF CONTENTS

VOLUME 149—SCIENTIFIC RESULTS

SECTION 1. INTRODUCTION

1. The western Iberia Margin: a geophysical and geological overview. 3
L.M. Pinheiro, R.C.L. Wilson, R. Pena dos Reis, R.B. Whitmarsh, and A. Ribeiro

SECTION 2. BIOSTRATIGRAPHY AND PALEONTOLOGY

2. Mesozoic calcareous nannofossil biostratigraphy from Sites 897, 899, and 901, Iberia Abyssal Plain: new biostratigraphic evidence. 27
E. de Kaenel and J.A. Bergen
3. Eocene calcareous nannofossils from the Iberia Abyssal Plain. 61
L. Liu
4. Oligocene-Miocene calcareous nannofossil biostratigraphy and paleoecology from the Iberia Abyssal Plain. 79
E. de Kaenel and G. Villa
5. Pliocene-Pleistocene calcareous nannofossils from the Iberia Abyssal Plain. 147
L. Liu, P. Maiorano, and X. Zhao
6. Cretaceous to Quaternary planktonic foraminiferal biostratigraphy of the Iberia Abyssal Plain. 165
E. Gervais
7. Tithonian benthic foraminifers from Hole 901A. 193
E.S. Collins, W. Kuhnt, and D.B. Scott
8. Cretaceous to Paleogene benthic foraminifers from the Iberia Abyssal Plain. 203
W. Kuhnt and E.S. Collins
9. Quaternary and Neogene benthic foraminifers from Sites 898 and 900, Iberia Abyssal Plain. 217
E.S. Collins, D.B. Scott, and J. Zhang
10. Palynology and dinoflagellate biostratigraphy of upper Cenozoic sediments from Sites 898 and 900, Iberia Abyssal Plain. 241
F.M.G. McCarthy and P.J. Mudie

SECTION 3. SEDIMENTS (LITHOLOGY, CHEMISTRY, PHYSICS, AND GEOTECHNICS)

11. Evolution of the Iberian passive margin as reflected in sand provenance. 269
K.M. Marsaglia, J.C. García y Barragán, I. Padilla, and K.L. Milliken
12. Pleistocene and Pliocene turbidites from the Iberia Abyssal Plain. 281
D. Milkert, P.P.E. Weaver, and L. Liu
13. Geochemical comparisons of organic matter in Cretaceous black shales from Site 897, Iberia Abyssal Plain, Sites 638 and 641, Galicia Margin, and Site 398, Vigo Seamount. 295
P.A. Meyers

14. The implications of turbidite-driven redox changes in sediments of the Iberia Abyssal Plain	301
T.J. Shaw and P.A. Meyers	
15. Organic matter in Pleistocene to Quaternary turbidites from Sites 897, 898, 899, and 900, Iberia Abyssal Plain.	305
P.A. Meyers and J.E. Silliman	
16. Magnetostratigraphy of Cenozoic sediments recovered from the Iberia Abyssal Plain	315
X. Zhao, D. Milkert, L. Liu, and T. Kanamatsu	
17. Magnetic fabric analysis of fine-grained sediments, Iberia Abyssal Plain	335
T. Kanamatsu	
18. In situ velocities of sedimentary rocks from the Iberia Abyssal Plain.	343
D.L. Harry and M. Batzle	
19. Clay mineral fabrics from the Iberia Abyssal Plain: recorders of postrift consolidation and deformation?	353
J.K. Morgan	
20. Uniaxial reconsolidation tests on porous sediments: mudstones from Site 897.	363
D.E. Karig	
 SECTION 4. ULTRAMAFIC ROCKS (GENESIS, EMPLACEMENT, AND PROPERTIES)	
21. Petrologic characteristics of the ultramafic rocks from the ocean/continent transition in the Iberia Abyssal Plain.	377
G. Cornen, M.-O. Beslier, and J. Girardeau	
22. Tectono-metamorphic evolution of peridotites from the ocean/continent transition of the Iberia Abyssal Plain margin.	397
M.-O. Beslier, G. Cornen, and J. Girardeau	
23. Geochemistry of serpentinized mantle peridotite from Site 897 in the Iberia Abyssal Plain.	413
K. Seifert and D. Brunette	
24. Acoustic properties of ultramafic rocks from the Iberia Abyssal Plain.	425
D.L. Harry and M. Batzle	
25. Magnetic signatures of peridotite rocks from Sites 897 and 899 and their implications.	431
X. Zhao	
 SECTION 5. MAFIC ROCKS (GENESIS, EMPLACEMENT, AND AGE)	
26. Petrology of the mafic rocks cored in the Iberia Abyssal Plain.	449
G. Cornen, M.-O. Beslier, and J. Girardeau	
27. Geochemistry of metamorphosed cumulate gabbros from Hole 900A, Iberia Abyssal Plain.	471
K. Seifert, I. Gibson, D. Weis, and D. Brunotte	
28. ⁴⁰ Ar/ ³⁹ Ar dating of gabbros from the ocean/continent transition of the western Iberia Margin: preliminary results.	489
G. Feraud, M.-O. Beslier, and G. Cornen	
29. Geochemistry of weathered mid-ocean ridge basalt and diabase clasts from Hole 899B in the Iberia Abyssal Plain.	497
K. Seifert and D. Brunotte	

SECTION 6. LOW TEMPERATURE ALTERATION AND MASS WASTING OF BASEMENT ROCKS

30. Major- and trace-element seawater alteration profiles in serpentinite formed during the development of the Iberia Margin, Site 897. 519
I.L. Gibson, M.-O. Beslier, G. Cornen, K.L. Milliken, and K.E. Seifert
31. Marine weathering of serpentinites and serpentinite breccias, Sites 897 and 899, Iberia Abyssal Plain. 529
K.L. Milliken, F.L. Lynch, and K.E. Seifert
32. Mineralogical and oxygen isotopic features of serpentinites recovered from the ocean/continent transition in the Iberia Abyssal Plain. 541
P. Agrinier, G. Cornen, and M.-O. Beslier
33. Chemical evidence for near-seafloor precipitation of calcite in serpentinites (Site 897) and serpentinite breccias (Site 899), Iberia Abyssal Plain. 553
K.L. Milliken and J.K. Morgan
34. Petrography of calcite veins in serpentinitized peridotite basement rocks from the Iberia Abyssal Plain, Sites 897 and 899: kinematic and environmental implications. 559
J.K. Morgan and K.L. Milliken
35. Serpentinite-breccia landslide deposits generated during crustal extension at the Iberia Margin. 571
I.L. Gibson, K.L. Milliken, and J.K. Morgan
36. Serpentinitized peridotite breccia and olistostrome on basement highs of the Iberia Abyssal Plain: implications for tectonic margin evolution. 577
M.C. Comas, M. Sánchez-Gómez, G. Cornen, and E. de Kaenel

SECTION 7. PHYSICAL PROPERTIES OF CORES RELATED TO GEOCHEMICAL LOGGING

37. Relationship between lithology and the neutron absorption cross section () of samples from Leg 149. 595
J.C. Lofts, P.K. Harvey, M.A. Lovell, and J. Locke

SECTION 8. TECTONICS AND REGIONAL GEOPHYSICS

38. Evidence for detachment tectonics on the Iberia Abyssal Plain rifted margin. 603
C.M. Krawczyk, T.J. Reston, M.-O. Beslier, and G. Boillot
39. Seismic stratigraphy and tectonic history of the Iberia Abyssal Plain. 617
R.C.L. Wilson, D.S. Sawyer, R.B. Whitmarsh, J. Zerong, and J. Carbonell
40. Dynamic models of multiphase continental rifting and their implications for the Newfoundland and Iberia conjugate margins. 635
D.L. Tett and D.S. Sawyer
41. Detailed relationship between tectonics and sedimentation from Pasisar deep-tow seismic data acquired in the Iberia Abyssal Plain. 649
J.-C. Sibuet, Y. Thomas, B. Marsset, H. Nouzé, V. Louvel, B. Savoye, and J.-P. Le Formal
42. Compilation of magnetic anomaly chart west of Iberia. 659
P.R. Miles, J. Verhoef, and R. Macnab

43. Geological and geophysical implications of deep-tow magnetometer observations near Sites 897, 898, 899, 900, and 901 on the west Iberia continental margin665
R.B. Whitmarsh, P.R. Miles, J.-C. Sibuet, and V. Louvel
44. Measurements of radiogenic heat production on basement samples from Sites 897 and 900.675
K.E. Loudon and J.-C. Mareschal

SECTION 9. SYNTHESSES

45. Sedimentary facies and depositional history of the Iberia Abyssal Plain685
D. Milkert, B. Alonso, L. Liu, X. Zhao, M. Comas, and E. de Kaenel
46. Organic matter accumulation, sulfate reduction, and methanogenesis in Pliocene-Pleistocene turbidites on the Iberia Abyssal Plain.705
P.A. Meyers and T.J. Shaw
47. The ocean/continent transition beneath the Iberia Abyssal Plain and continental-rifting to seafloor-spreading processes.713
R.B. Whitmarsh and D.S. Sawyer

SECTION 10. DATA REPORTS

48. *Data Report:* Seismic line LG12 in the Iberia Abyssal Plain.737
M.-O. Beslier
49. *Data Report:* Textural and mineral composition of Cenozoic sedimentary facies off the Western Iberian Peninsula, Sites 897, 898, 899, and 900.741
B. Alonso, M.C. Comas, G. Ercilla, and A. Palanques

SECTION 11. INDEX

- Index.757

BACK-POCKET MATERIALS

Chapter 4:

Table 9. Stratigraphic distribution of calcareous nannofossil taxa in Hole 900A (Cores 149-900A-11R-CC through 53R).

Chapter 39:

Figure 2. Location map of the line drawings of interpreted seismic lines shown on Figure 3. Part of the structural map of Masson et al. (1994) is included to show the distribution of Miocene folding and faulting.

Figure 3. Line drawings of interpretations of migrated seismic lines LG04, LG12, SO16, SO17, SO18, and SO20. The location of these lines is shown on text Figure 1 and on Figure 2 of Chapter 39 on this back-pocket foldout. Roman numerals at site locations indicate the lithostratigraphic units drilled and described in the Leg 149 *Initial Reports* volume (Sawyer, Whitmarsh, Klaus, et al., 1994).

Chapter 42:

Figure 1. Magnetic anomaly chart of the Northeast Atlantic Ocean adjacent to the Iberian peninsula.

Chapter 48:

Figure 2. Three sections (a, b, and c) of seismic line LG12 (time migrated), from west to east (see location in Fig. 1). Section d is a pre-stack depth migration of the section framed on c (from Beslier et al., 1995).
