

28. DATA REPORT: GEOCHEMISTRY OF ROCKS AND MINERALS OF THE GABBRO COMPLEX FROM THE MARK AREA¹

Carl-Dietrich Werner²

INTRODUCTION

Leg 153 represents an Ocean Drilling Program (ODP) offset drilling leg in the MARK area (Mid-Atlantic Ridge at the Kane Transform), around 22°33' N, 45°1.9' W. Shipboard documentation has shown that the gabbroic rocks from Sites 921, 922, and 923 are part of a layered complex and are generally similar, although cumulus textures are particularly well developed in the rocks from Site 922. These rocks also exhibit some special geochemical features.

Major- and trace-element chemistries were studied from a limited pool of 26 samples from nine holes. In some polished thin sections, the chemical compositions of olivines, orthopyroxenes, clinopyroxenes, amphiboles, and plagioclases were determined using an electron microprobe. These data are presented here as a data report; a detailed paper will be prepared, if additional rock samples are analyzed, and if fluid inclusions and oxygen isotope data become available.

SAMPLE MATERIAL

All gabbroic rock samples in this study are from Holes 153-921A, 921B, 921C, 921E, 922A, 922B, and 923A. Two diabase vein rocks are from Holes 920B and 920D. The special designations correspond to shipboard documentation and to standard ODP sample nomenclature conventions, but, for clarity, single numbers are generally used in the data tables (Table 1). The individual rock names were determined after microscopic investigation and calculation of mineral norms in accordance with the CIPW system (after the authors Cross, Iddings, Pearson, and Washington).

ANALYTICAL METHODS

Whole-Rock Chemistry

Major-element oxides and the trace elements Cl, Co, Cr, Cu, F, Ga, Nb, Ni, Pb, S, Sc, V, Y, Zn, and Zr were measured by X-ray fluorescence spectroscopy using a Phillips PW 1480 sequential spectrometer. Glass discs were prepared by melting the powdered, but not ignited, whole-rock material with lithium tetraborate. International reference rocks, as well as two internal mafic standard samples, were used for calibration of the method.

K, Li, Na, Rb, and Zn were analyzed using flame photometry, and Ba and Sr were analyzed using inductively coupled plasma-atomic emission spectroscopy using a Perkin-Elmer PLASMA 1000 spectrometer. B was determined by optical spectroscopy, with boron-free spectral carbons, using a Carl Zeiss PGS 2 spectrograph.

GABI OIGb*			Olivine gabbro

Note: * = Leg 153 internal laboratory standard.

The results of the chemical investigation are compiled in Table 2 (major-element oxides in wt%) and Table 3 (trace elements in ppm). The CIPW norm mineral data are presented in Table 4 and supplemented by the Thornton-Tuttle Index (TTI: Q + or + ab + lc + ne), normative anorthite content in plagioclase (An*), and the Mg number ($Mg\# = Mg/[Mg + Fe]$). Selected element ratios are also listed in Table 4.

Finally, Table 5 presents the mean values of our analytical data from Leg 153 gabbroic rock types (major-element oxides and trace elements); results of calculations of the CIPW norms are listed in Table 6. Initial views of the positions of the individual gabbroic rocks are indicated in Figures 1–5.

Mineral Chemistry

The chemical composition of the individual minerals was measured from polished thin sections on a WDX microprobe, using the CAMEBAX S 50 at the Ruhr-Universität Bochum. Several synthetic reference samples were available for calibration.

Altogether, more than 2500 points were analyzed, hence, only a selection of typical data is given in Tables 7–11. In most cases, the

Note: Abbreviations as in Table 3.

mean values from several analyses with nearly equal results of an individual grain are listed. In some cases, the analytical data of profiles through one grain are provided.

The Mg value (Mg#) is given for the minerals olivine, orthopyroxene, clinopyroxene, and amphibole; Ca# (= Ca/[Ca + Mg]) is also provided for clinopyroxenes; and the calculated anorthite content (An#) is presented for plagioclases.

SUMMARY

Twenty-six samples of gabbroic rocks from Leg 153 were analyzed for major-element oxides and 21 trace elements. In a limited number of thin sections, the mineral chemistries of olivine, orthopyroxene, clinopyroxene, amphibole, and plagioclase were investigated using an electron microprobe. This data report will form the basis for further work.

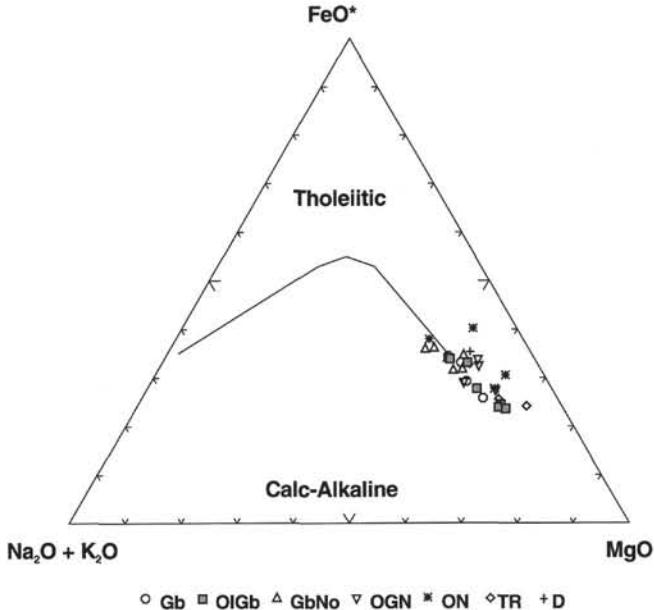

Figure 1. Projection of compositions of Leg 153 gabbros on a (Na₂O + K₂O) – FeO* – MgO (= AFM) triangle, after Irvine and Baragar (1971).

ACKNOWLEDGMENTS

This work was supported by a grant from the Deutsche Forschungsgemeinschaft, Bonn. H.-J. Bernhard (Bochum), B. Knipping (Clausthal), and G. Bombach and E. Rüdiger (Freiberg) assisted with the analytical procedures. I wish to thank all these colleagues and their institutions.
