Pieces 1-12 (0-122cm)

Fine → med. grained vesicular BASALT
Strongly to completely disrupted by exfoliative dessication.
Pieces 1, 2 and 11 are still coherent + retain an igneous texture. Abundant, 1-3mm, clay/chlorite filled vesicles commonly concentrated in aligned ARRAYS! Intersertal to subophitic texture. Tabular plag laths in piece 1 are strongly aligned with a moderately dipping orientation (visible on drilled surface - ? flow banding ?) (- DRILLING ARTIFACT? PROBABLY - DISREGARD O.T. RD. PN
Conjugate chlorite filled fractures occur at all through section, preserved v. well in Piece (1).

Piece 11 is med, aspiring to be coarse, grained. Plagioclase (3mm long) xtals in grdmass. Mesostasis altered to green chlorite / smectite / actinolite.
