

ACKNOWLEDGMENTS

Leg 171A owes its existence to the entire ODP system that flexibly fostered a partial leg and provided financial support for the extra costs of the logging-while-drilling operations. Success of the operations depended on the reliable, high-quality instrumentation provided by Anadrill-Schlumberger and its dedicated engineers, Peter Ireland and Tom Horton. We are grateful for the support of the scientific objectives by the thematic panels of JOI/ODP and the Downhole Measurements Panel and the Lamont-Doherty Earth Observatory Borehole Research Group in promoting the application of logging while drilling in the Ocean Drilling Program.

While at sea, our operations were smoothly facilitated by the excellent seamanship of Ed Oonk and the crew of the *JOIDES Resolution*. Wayne Malone, Scott McGrath, and the Sedco rig floor personnel worked systematically and carefully to achieve five penetrations of the unstable proto-décollement/décollement zone. The technical staff, led by Burney Hamlin, attended to our shipboard needs. Michiko Hitchcox meticulously assembled documents produced at sea and was critical in boosting the morale on a cruise that spanned the holidays. The courteous and efficient publication staff at TAMU/ODP greatly facilitated production of this volume.
